## FOREWORD

The more complex industry becomes, the more vital becomes the role played by fluids in the industrial machine. One hundred years ago water was the only important fluid which was conveyed from one point to another in pipe. Today, almost every conceivable fluid is handled in pipe during its production, processing, transportation, or utilization. The age of atomic energy and rocket power has added fluids such as liquid metals . . . i.e., sodium, potassium, and bismuth, as well as liquid oxygen, nitrogen, etc. . . . to the list of more common fluids such as oil, water, gases, acids, and liquors that are being transported in pipe today. Nor is the transportation of fluids the only phase of hydraulics which warrants attention now. Hydraulic and pneumatic mechanisms are used extensively for the controls of modern aircraft, sea-going vessels, automotive equipment, machine tools, earth-moving and road-building machines, and even in scientific laboratory equipment where precise control of fluid flow is required.

So extensive are the applications of hydraulics and fluid mechanics that almost every engineer has found it necessary to familiarize himself with at least the elementary laws of fluid flow. To satisfy a demand for a simple and practical treatment of the subject of flow in pipe, Crane Co. published in 1935, a booklet entitled *Flow of Fluids and Heat Transmission*. A revised edition on the subject of *Flow of Fluids Through Valves, Fittings, and Pipe* was published in 1942. Technical Paper No. 410, a completely new edition with an all-new format was introduced in 1957. In T.P. 410, Crane has endeavored to present the latest available information on flow of fluids, in summarized form with all auxiliary data necessary to the solution of all but the most unusual fluid flow problems.

From 1957 until the present, there have been numerous printings of Technical Paper No. 410. Each successive printing is updated, as necessary, to reflect the latest flow information available. This continual updating, we believe, serves the best interests of the users of this publication.

The fifteenth printing (1976 edition) presented a conceptual change regarding the values of Equivalent Length " $L/D$ " and Resistance Coefficient " $K$ " for valves and fittings relative to the friction factor in pipes. This change had relatively minor effect on most problems dealing with flow conditions that result in Reynolds numbers falling in the turbulent zone. However, for flow in the laminar zone, the change avoided a significant overstatement of pressure drop. Consistent with the conceptual revision, the resistance to flow through valves and fittings was expressed in terms of resistance coefficient " $K$ " instead of equivalent length " $L/D$ ", and the coverage of valve and fitting types was expanded.

Further important revisions included the updating of steam viscosity data, orifice coefficients, and nozzle coefficients.

T.P. 410M was introduced in early 1977 as a metric version of the fifteenth printing of T.P. 410. Technical data, with certain exceptions, are presented in terms of SI metric units. Exceptions occur in instances where present units outside the SI system (e.g. nominal pipe sizes in inches) are expected to continue in use for an indefinite period, or where agreement has not yet been reached on the specific metric units to be used (as for flow coefficients).

Successive printings of T.P. 410M, like T.P. 410, are updated as necessary to reflect latest flow information available. Arrangement of material is alike in both editions. Theory is presented in Chapters 1 and 2 . . . practical application to flow problems in Chapters 3 and 4 . . . physical properties of fluids and flow characteristics of valves, fittings, and pipe in Appendix A . . . and conversion units and other useful engineering data in Appendix B.

Most of the data on flow through valves and fittings were obtained by carefully conducted experiments in the Crane Engineering Laboratories. Liberal use has been made, however, of other reliable sources of data on this subject and due credit has been given these sources in the text. The bibliography of references will provide a source for further study of the subject presented.

# Table of Contents

## CHAPTER 1

Theory of Flow in Pipe	page
Introduction .....	1-1
Physical Properties of Fluids .....	1-2
Viscosity .....	1-2
Density .....	1-3
Specific volume .....	1-3
Specific gravity .....	1-3
Nature of Flow in Pipe --	
Laminar and Turbulent .....	1-4
Mean velocity of flow .....	1-4
Reynolds number .....	1-4
Hydraulic radius .....	1-4
General Energy Equation --	
Bernoulli's Theorem .....	1-5
Measurement of Pressure .....	1-5
Darcy's Formula --	
General Equation for Flow of Fluids .....	1-6
Friction factor .....	1-6
Effect of age and use on pipe friction .....	1-7
Principles of Compressible Flow in Pipe .....	1-7
Complete isothermal equation .....	1-8
Simplified compressible flow --	
gas pipe line formula .....	1-8
Other commonly used formulas for	
compressible flow in long pipe lines .....	1-8
Comparison of formulas for	
compressible flow in pipe lines .....	1-8
Limiting flow of gases and vapors .....	1-9
Steam -- General Discussion .....	1-10

## CHAPTER 3

Formulas and Nomographs for Flow Through Valves, Fittings, and Pipe	page
Introduction .....	3-1
Summary of Formulas .....	3-2 to 3-5
Formulas and Nomographs for Liquid Flow	
Velocity .....	3-6
Reynolds number; friction factor for	
clean steel pipe .....	3-8
Pressure drop for turbulent flow .....	3-10
Pressure drop for laminar flow .....	3-12
Flow through nozzles and orifices .....	3-14
Formulas and Nomographs for Compressible Flow	
Velocity .....	3-16
Reynolds number; friction factor for	
clean steel pipe .....	3-18
Pressure drop .....	3-20
Simplified flow formula .....	3-22
Flow through nozzles and orifices .....	3-26

## CHAPTER 2

Flow of Fluids Through Valves and Fittings	page
Introduction .....	2-1
Types of Valves and Fittings Used in Pipe Systems .....	2-2
Pressure Drop Chargeable to Valves and Fittings .....	2-2
Crane Flow Tests	
Description of apparatus used .....	2-3
Water flow tests .....	2-4
Steam flow tests .....	2-5
Relationship of Pressure Drop to Velocity of Flow .....	2-7
Resistance Coefficient K, Equivalent Length L/D, and Flow Coefficient .....	2-8
Laminar Flow Conditions .....	2-11
Contraction and Enlargement .....	2-11
Valves with Reduced Seats .....	2-12
Resistance of Bends .....	2-12
Resistance of Mitre Bends .....	2-13
Flow Through Nozzles and Orifices	
General data .....	2-14
Liquid Flow .....	2-14
Gas and vapor flow .....	2-14
Maximum flow of compressible fluids in a nozzle .....	2-15
Flow through short tubes .....	2-15
Discharge of Fluids Through Valves, Fittings, and Pipe	
Liquid flow .....	2-15
Compressible flow .....	2-15

## CHAPTER 4

Examples of Flow Problems	page
Introduction .....	4-1
Reynolds Number and Friction Factor for Pipe Other than Steel .....	4-1
Determination of Valve Resistance in L, L/D, K, and Flow Coefficient C <sub>v</sub> .....	4-2
Check Valves -- Determination of Size .....	4-3
Reduced Port Valves -- Velocity and Rate of Discharge .....	4-3
Laminar Flow in Valves, Fittings, and Pipe .....	4-4
Pressure Drop and Velocity in Piping Systems .....	4-6
Pipe Line Flow Problems .....	4-10
Discharge of Fluids from Piping Systems .....	4-12
Flow Through Orifice Meters .....	4-15
Application of Hydraulic Radius to Flow Problems .....	4-16

APPENDIX A

Physical Properties of Fluids  
and Flow Characteristics of  
Valves, Fittings, and Pipe

	page
Introduction .....	A-1
Physical Properties of Fluids	
Viscosity of steam .....	A-2
Viscosity of water .....	A-2, A-3
Viscosity of liquid petroleum products .....	A-3
Viscosity of various liquids .....	A-4
Viscosity of gases and hydrocarbon vapors .....	A-5
Viscosity of refrigerant vapors .....	A-5
Physical properties of water .....	A-6
Specific gravity – temperature relationship for petroleum oils .....	A-7
Density and specific gravity of various liquids .....	A-7
Physical properties of gases .....	A-8
Steam – values of $\gamma$ .....	A-9
Density and specific volume of gases and vapors .....	A-10
Volumetric composition and specific gravity of gaseous fuels .....	A-12
Properties; saturated steam .....	A-13
Properties; superheated steam .....	A-15
Flow Characteristics of Nozzles and Orifices	
Flow coefficient $C$ for nozzles .....	A-20
Flow coefficient $C$ for square edged orifices .....	A-20
Net expansion factor $Y$ for compressible flow .....	A-21
Critical pressure ratio, $r_c$ for compressible flow .....	A-21
Flow Characteristics of Pipe, Valves, and Fittings	
Net expansion factor $Y$ for compressible flow through pipe to a larger flow area .....	A-22
Relative roughness of pipe materials and friction factor for complete turbulence .....	A-23
Friction factors for any type of commercial pipe .....	A-24
Friction factors for clean commercial steel pipe .....	A-25
Representative Resistance Coefficients ( $K$ ) for Valves and Fittings – “ $K$ ” Factor Table	
Pipe friction factors .....	A-26
Formulas; contraction and enlargement .....	A-26
Formulas; reduced port valves and fittings .....	A-26
Gate, globe and angle valves .....	A-27
Cheek valves .....	A-27
Stop-check and foot valves .....	A-28
Ball and butterfly valves .....	A-28
Plug valves and cocks .....	A-29

# Nomenclature

Unless otherwise stated, all symbols used in this book are defined as follows:

- $A$  = cross sectional area of pipe or orifice, in square metres  
 $a$  = cross sectional area of pipe or orifice, or flow area in valve, in square millimetres  
 $B$  = rate of flow in barrels (42 US gallons) per hour  
 $C$  = flow coefficient for orifices and nozzles = discharge coefficient corrected for velocity of approach =  $C_d / \sqrt{1 - \beta^4}$   
 $C_d$  = discharge coefficient for orifices and nozzles  
 $C_v$  = flow coefficient for valves  
 $D$  = internal diameter of pipe, in metres  
 $d$  = internal diameter of pipe, in millimetres  
 $e$  = base of natural logarithm = 2.718  
 $f$  = friction factor in formula  $h_L = fL v^2 / D 2g_n$   
 $f_T$  = friction factor in zone of complete turbulence  
 $g_n$  = acceleration of gravity = 9.81 metres per second per second  
 $H$  = total head, in metres of fluid  
 $h$  = static pressure head existing at a point, in metres of fluid  
 $h_L$  = loss of static pressure head due to fluid flow, in metres of fluid  
 $h_w$  = static pressure head, in millimetres of water  
 $K$  = resistance coefficient or velocity head loss in the formula,  $h_L = K v^2 / 2g_n$   
 $L$  = length of pipe, in metres  
 $L/D$  = equivalent length of a resistance to flow, in pipe diameters  
 $L_m$  = length of pipe, in kilometres  
 $M$  = molecular weight (molecular mass)  
 $P$  = pressure, in newtons per square metre (pascals) gauge  
 $P'$  = pressure, in newtons per square metre (pascals) absolute  
*(see page 1-5 for diagram showing relationship between gauge and absolute pressure)*  
 $p$  = pressure, in bars gauge  
 $p'$  = pressure, in bars absolute  
 $Q$  = rate of flow, in litres per minute  
 $q$  = rate of flow, in cubic metres per second at flowing conditions  
 $q'$  = rate of flow, in cubic metres per second at metric standard conditions (MSC)—1.013 25 bar absolute and 15°C  
 $q'_d$  = rate of flow, in millions of cubic metres per day at MSC  
 $q'_h$  = rate of flow, in cubic metres per hour at MSC  
 $q'_m$  = rate of flow, in cubic metres per minute at flowing conditions  
 $q'_m$  = rate of flow, in cubic metres per minute at MSC  
 $R_o$  = universal gas constant = 8314 J/kg—mol K  
 $R$  = individual gas constant =  $R_o / M$  J/kg K (where  $M$  = molecular weight of the gas)  
 $R_e$  = Reynolds number  
 $R_H$  = hydraulic radius, in metres  
 $r_c$  = critical pressure ratio for compressible flow  
 $S$  = specific gravity of liquids at specified temperature relative to water at standard temperature (15°C) — (relative density)

- $S_g$  = specific gravity of a gas relative to air = the ratio of the molecular weight of the gas to that of air (relative density)  
 $T$  = absolute temperature, in kelvins (273 +  $t$ )  
 $t$  = temperature, in degrees Celsius  
 $\bar{V}$  = specific volume of fluid, in cubic metres per kilogram  
 $V$  = mean velocity of flow, in metres per minute  
 $V_a$  = volume, in cubic metres  
 $v$  = mean velocity of flow, in metres per second  
 $v_s$  = sonic (or critical) velocity of flow of a gas, in metres per second  
 $W$  = rate of flow, in kilograms per hour  
 $w$  = rate of flow, in kilograms per second  
 $w_a$  = mass, in kilograms  
 $Y$  = net expansion factor for compressible flow through orifices, nozzles, or pipe  
 $Z$  = potential head or elevation above reference level, in metres

## Greek Letters

### Beta

- $\beta$  = ratio of small to large diameter in orifices and nozzles, and contractions or enlargements in pipes

### Gamma

- $\gamma$  = ratio of specific heat at constant pressure to specific heat at constant volume =  $c_p / c_v$

### Delta

- $\Delta$  = differential between two points

### Epsilon

- $\epsilon$  = absolute roughness or effective height of pipe wall irregularities, in millimetres

### Mu

- $\mu$  = dynamic (absolute) viscosity, in centipoise  
 $\mu'$  = dynamic viscosity, in newton seconds per square metre (pascal seconds)

### Nu

- $\nu$  = kinematic viscosity, in centistokes  
 $\nu'$  = kinematic viscosity, metres squared per second

### Rho

- $\rho$  = weight density of fluid, kilograms per cubic metre  
 $\rho'$  = density of fluid, grams per cubic centimetre

### Sigma

- $\Sigma$  = summation

### Theta

- $\theta$  = angle of convergence or divergence in enlargements or contractions in pipes

## Subscripts for Diameter

- (1) ...defines smaller diameter
- (2) ...defines larger diameter

## Subscripts for Fluid Property

- (1) ...defines inlet (upstream) condition
- (2) ...defines outlet (downstream) condition

# Theory of Flow In Pipe

## CHAPTER 1

The most commonly employed method of transporting fluid from one point to another is to force the fluid to flow through a piping system. Pipe of circular section is most frequently used because that shape offers not only greater structural strength, but also greater cross sectional area per unit of wall surface than any other shape. Unless otherwise stated, the word "pipe" in this book will always refer to a closed conduit of circular section and constant internal diameter.

Only a few special problems in fluid mechanics . . . laminar flow in pipe, for example . . . can be entirely solved by rational mathematical means; all other problems require methods of solution which rest, at least in part, on experimentally determined coefficients. Many empirical formulas have been proposed for the problem of flow in pipe, but these are often extremely limited and can be applied only when the conditions of the problem closely approach the conditions of the experiments from which the formulas were derived.

Because of the great variety of fluids being handled in modern industrial processes, a single equation which can be used for the flow of any fluid in pipe offers obvious advantages. Such an equation is the Darcy\* formula. The Darcy formula can be derived rationally by means of dimensional analysis; however, one variable in the formula . . . the friction factor . . . must be determined experimentally. This formula has a wide application in the field of fluid mechanics and is used extensively throughout this paper.

\*The Darcy formula is also known as the Weisbach formula or the Darcy-Weisbach formula; also, as the Fanning formula, sometimes modified so that the friction factor is one-fourth the Darcy friction factor.

## Physical Properties of Fluids

The solution of any flow problem requires a knowledge of the physical properties of the fluid being handled. Accurate values for the properties affecting the flow of fluids . . . namely, viscosity and mass density . . . have been established by many authorities for all commonly used fluids and many of these data are presented in the various tables and charts in Appendix A.

**Viscosity:** Viscosity expresses the readiness with which a fluid flows when it is acted upon by an external force. The coefficient of absolute viscosity or, simply, the absolute viscosity of a fluid, is a measure of its resistance to internal deformation or shear. Molasses is a highly viscous fluid; water is comparatively much less viscous; and the viscosity of gases is quite small compared to that of water.

Although most fluids are predictable in their viscosity, in some, the viscosity depends upon the previous working of the fluid. Printer's ink, wood pulp slurries, and catsup are examples of fluids possessing such thixotropic properties of viscosity.

Considerable confusion exists concerning the units used to express viscosity; therefore, proper units must be employed whenever substituting values of viscosity into formulas.

**Dynamic or Absolute Viscosity:** The coherent SI unit of dynamic viscosity is the pascal second (Pa s) which may also be expressed as the newton second per square metre (N s/m<sup>2</sup>), or as the kilogram per metre second kg/(m s). This unit has also been called the poiseuille (PI) in France but it should be noted that it is not the same as the poise (P) described below.

The poise is the corresponding unit in the CGS system of units and has the dimensions of dyne seconds per square centimetre or of grams per centimetre second. The submultiple centipoise (cP), 10<sup>-2</sup> poise, is the unit most commonly used at present to express dynamic viscosity and this situation appears likely to continue for some time. For this reason, and since most handbooks and tables follow the same procedure, all viscosity data in this paper are expressed in centipoise. The relationship between pascal second and centipoise is:

$$\begin{aligned} 1 \text{ Pa s} &= 1 \text{ N s/m}^2 = 1 \text{ kg/(m s)} = 10^3 \text{ cP} \\ 1 \text{ cP} &= 10^{-3} \text{ Pa s} \end{aligned}$$

In this paper the symbol  $\mu$  is used for viscosity measured in centipoise and  $\mu'$  for viscosity measured in pascal second units. The viscosity of water at temperature of 20°C is very nearly 1 centipoise\* or 0.001 pascal seconds.

**Kinematic Viscosity:** This is the ratio of the dynamic viscosity to the density. In the SI system the unit of kinematic viscosity is the metre squared per second (m<sup>2</sup>/s). The corresponding CGS unit is the stokes (St), dimensions, centimetres squared per second and the centistoke (cSt), 10<sup>-2</sup> stokes, is the submultiple commonly used.

$$1 \text{ m}^2/\text{s} = 10^6 \text{ cSt}$$

$$1 \text{ cSt} = 10^{-6} \text{ m}^2/\text{s}$$

$$\nu \text{ (Centistokes)} = \frac{\mu \text{ (centipoise)}}{\rho' \text{ (grams per cubic cm)}}$$

Factors for conversion between the SI and CGS units described above and also for Imperial units of dynamic and kinematic viscosity are given on page B-3 of Appendix B.

The measurement of the absolute viscosity of fluids (especially gases and vapours) requires elaborate equipment and considerable experimental skill. On the other hand, a rather simple instrument in the form of a tube viscometer or viscosimeter can be used for measuring the kinematic viscosity of oils and other viscous liquids. With this type of instrument the time required for a small volume of liquid to flow through an orifice is determined and the measurement of kinematic viscosity expressed in terms of seconds.

Various forms of tube viscosimeters are used resulting in empirical scales such as Saybolt Universal, Saybolt Furoil (for very viscous liquids), Redwood No 1 and No 2 and Engler. Information on the relationships between these empirical viscosities and kinematic and dynamic viscosities in absolute units is included in Appendix B.

The ASTM standard viscosity temperature chart for liquid petroleum products, reproduced on page B-6 is used to determine the Saybolt Universal viscosity of a petroleum product at any temperature when the viscosities at two different temperatures are known. The viscosities of some of the most common fluids are given on pages A-2 to A-5. It will be noted that, with a rise in temperature, the viscosity of liquids decreases, whereas the viscosity of gases increases. The effect of pressure on the viscosity of liquids and perfect gases is so small that it is of no practical interest in most flow problems. Conversely, the viscosity of saturated, or only slightly superheated, vapours is appreciably altered by pressure changes, as indicated on page A-2 showing the viscosity of steam. Unfortunately, the data on vapours are incomplete and, in some cases, contradictory. Therefore, it is expedient when dealing with vapours other than steam to neglect the effect of pressure because of the lack of adequate data.

\*Actually the viscosity of water at 20°C is 1.002 centipoise ("Handbook of Chemistry and Physics" 54th Edition 1973-4 CRC Press)

## Physical Properties of Fluids — continued

**Density, specific volume and specific gravity:** The density of a substance is its mass per unit volume. The coherent SI unit of density is the kilogram per cubic metre ( $\text{kg/m}^3$ ) and the symbol designation used in this paper is  $\rho$  (Rho).

Other commonly used metric units are:

$$\left. \begin{array}{l} \text{gram per cubic centimetre (g/cm}^3\text{)} \\ \text{or} \\ \text{gram per millilitre (g/ml)} \end{array} \right\} \begin{array}{l} 1 \text{ g/cm}^3 \\ \text{or } 1 \text{ g/ml} \\ = 1000 \text{ kg/m}^3 \end{array}$$

The coherent SI unit of specific volume  $\bar{V}$ , which is the reciprocal of density, is the cubic metre per kilogram ( $\text{m}^3/\text{kg}$ )

$$\bar{V} = \frac{1}{\rho} \quad \rho = \frac{1}{\bar{V}}$$

Other commonly used metric units for specific volume are:

$$\left. \begin{array}{l} \text{litre per kilogram (litre/kg)} \\ \text{or} \\ \text{cubic decimetre per kilogram (dm}^3\text{/kg)} \end{array} \right\} \begin{array}{l} 1 \text{ litre/kg} \\ \text{or } 1 \text{ dm}^3\text{/kg} \\ = 0.001 \text{ m}^3\text{/kg} \end{array}$$

The variations in density and other properties of water with changes in temperature are shown on page A-6. The densities of other common liquids are shown on page A-7. Unless very high pressures are being considered the effect of pressure on the density of liquids is of no practical importance in flow problems.

The densities of gases and vapours, however, are greatly altered by pressure changes. For the so-called "perfect" gases, the density can be computed from the formula.

$$\rho = \frac{P'}{RT} \quad \text{or} \quad \frac{10^5 p'}{RT}$$

The individual gas constant  $R$  is equal to the universal gas constant  $R_o$  (8314 J/kg-mol K) divided by the molecular weight  $M$  of the gas,

$$R = \frac{R_o}{M} = \frac{8314}{M} \text{ J/kg K}$$

Values of  $R$ , as well as other useful gas constants, are given on page A-8. The density of air for various conditions of temperature and pressure can be found on page A-10.

Specific volume is commonly used in steam flow computations and values are listed in the steam tables shown on pages A-13 to A-17. A chart for determining the density and specific volume of gases is given on page A-11.

Specific gravity (or relative density) is a relative measure of density. Since pressure has an insignificant effect upon the density of liquids, temperature is the only condition that must be considered in designating the basis for specific gravity. The specific gravity of a liquid is the ratio of its density at a specified temperature to that of water at some standard temperature. Usually the temperatures are the same and  $60^\circ\text{F}/60^\circ\text{F}$  ( $15.6^\circ\text{C}/15.6^\circ\text{C}$ ) is commonly used. Rounding off to  $15^\circ\text{C}/15^\circ\text{C}$  does not create any significant error.

$$S = \frac{\rho \text{ any liquid at specified temperature}}{\rho \text{ water at } 60^\circ\text{F (15.6}^\circ\text{C)}}$$

A hydrometer can be used to measure the specific gravity of a liquid directly. Two hydrometer scales in common use are:

API scale, used for oils.

Baumé scales. There are two kinds in use: one for liquids heavier than water and one for liquids lighter than water.

The relationships between these hydrometer scales and specific gravity are:

For oils,

$$S (60^\circ\text{F}/60^\circ\text{F}) = \frac{141.5}{131.5 + \text{deg. API}}$$

For liquids lighter than water,

$$S (60^\circ\text{F}/60^\circ\text{F}) = \frac{140}{130 + \text{deg. Baumé}}$$

For liquids heavier than water,

$$S (60^\circ\text{F}/60^\circ\text{F}) = \frac{145}{145 - \text{deg. Baumé}}$$

For converting hydrometer readings to more useful units refer to table on page B-7.

The specific gravity of gases is defined as the ratio of the molecular weight of the gas to that of air, and as the ratio of the individual gas constant of air to that of gas.

$$S_g = \frac{R(\text{air})}{R(\text{gas})} = \frac{M(\text{gas})}{M(\text{air})}$$

### Nature of Flow in Pipe — Laminar and Turbulent

**Figure 1-1**  
**Laminar Flow**

Actual photograph of coloured filaments being carried along undisturbed by a stream of water.

**Figure 1-2**  
**Flow in Critical Zone, Between Laminar and Transition Zones**

At the critical velocity, the filaments begin to break up, indicating flow is becoming turbulent.

**Figure 1-3**  
**Turbulent Flow**

This illustration shows the turbulence in the stream completely dispersing the coloured filaments a short distance downstream from the point of injection.

A simple experiment (illustrated above) will readily show there are two entirely different types of flow in pipe. The experiment consists of injecting small streams of a coloured fluid into a liquid flowing in a glass pipe and observing the behaviour of these coloured streams at different sections downstream from their points of injection.

If the discharge or average velocity is small, the streaks of coloured fluid flow in straight lines, as shown in Figure 1-1. As the flow rate is gradually increased, these streaks will continue to flow in straight lines until a velocity is reached when the streaks will waver and suddenly break into diffused patterns, as shown in Figure 1-2. The velocity at which this occurs is called the "critical velocity". At velocities higher than "critical", the filaments are dispersed at random throughout the main body of the fluid, as shown in Figure 1-3.

The type of flow which exists at velocities lower than "critical" is known as laminar flow and, sometimes, as viscous or streamline flow. Flow of this nature is characterized by the gliding of concentric cylindrical layers past one another in orderly fashion. Velocity of the fluid is at its maximum at the pipe axis and decreases sharply to zero at the wall.

At velocities greater than "critical", the flow is turbulent. In turbulent flow, there is an irregular random motion of fluid particles in directions transverse to the direction of the main flow. The velocity distribution in turbulent flow is more uniform across the pipe diameter than in laminar flow. Even though a turbulent motion exists throughout the greater portion of the pipe diameter, there is always a thin layer of fluid at the pipe wall . . . known as the "boundary layer" or "laminar sub-layer" . . . which is moving in laminar flow.

**Mean velocity of flow:** The term "velocity", unless otherwise stated, refers to the mean, or average, velocity at a given cross section, as determined by the continuity equation for steady state flow:

$$v = \frac{q}{A} = \frac{w}{A\rho} = \frac{w\bar{V}}{A} \quad \text{Equation 1-1}$$

(For nomenclature, see page preceding Chapter 1)

"Reasonable" velocities for use in design work are given on pages 3-6 and 3-16.

**Reynolds number:** The work of Osborne Reynolds has shown that the nature of flow in pipe . . . that is, whether it is laminar or turbulent . . . depends on the pipe diameter, the density and viscosity of the flowing fluid, and the velocity of flow. The numerical value of a dimensionless combination of these four variables, known as the Reynolds number, may be considered to be the ratio of the dynamic forces of mass flow to the shear stress due to viscosity. Reynolds number is:

$$R_e = \frac{Dvp}{\mu'} \quad \text{or} \quad \frac{dvp}{\mu} \quad \text{Equation 1-2}$$

(other forms of this equation; page 3-2.)

For engineering purposes, flow in pipes is usually considered to be laminar if the Reynolds number is less than 2000, and turbulent if the Reynolds number is greater than 4000. Between these two values lies the "critical zone" where the flow . . . being laminar, turbulent, or in the process of change, depending upon many possible varying conditions . . . is unpredictable. Careful experimentation has shown that the laminar zone may be made to terminate at a Reynolds number as low as 1200 or extended as high as 40,000, but these conditions are not expected to be realized in ordinary practice.

**Hydraulic radius:** Occasionally a conduit of non-circular cross section is encountered. In calculating the Reynolds number for this condition, the equivalent diameter (four times the hydraulic radius) is substituted for the circular diameter. Use friction factors given on pages A-24 and A-25.

$$R_H = \frac{\text{cross sectional flow area}}{\text{wetted perimeter}}$$

This applies to any ordinary conduit (circular conduit not flowing full, oval, square or rectangular) but not to extremely narrow shapes such as annular or elongated openings, where width is small relative to length. In such cases, the hydraulic radius is approximately equal to one-half the width of the passage.

To determine quantity of flow in following formula:

$$Q = 0.2087d^2 \sqrt{\frac{h_L D}{fL}}$$

the value of  $d^2$  is based upon an equivalent diameter of actual flow area and  $4R_H$  is substituted for  $D$ .

General Energy Equation

Bernoulli's Theorem

The Bernoulli theorem is a means of expressing the application of the law of conservation of energy to the flow of fluids in a conduit. The total energy at any particular point, above some arbitrary horizontal datum

plane, is equal to the sum of the elevation head, the pressure head, and the velocity head, as follows:

$$Z + \frac{P}{\rho g_n} + \frac{v^2}{2g_n} = H$$

If friction losses are neglected and no energy is added to, or taken from, a piping system (i.e., pumps or turbines), the total head,  $H$ , in the above equation will be a constant for any point in the fluid. However, in actual practice, losses or energy increases or decreases are encountered and must be included in the Bernoulli equation. Thus, an energy balance may be written for two points in a fluid, as shown in the example in Figure 1-4.

Note the pipe friction loss from point 1 to point 2 ( $h_L$ ) may be referred to as the head loss in metres of fluid. The equation may be written as follows:

Equation 1-3

$$Z_1 + \frac{P_1}{\rho_1 g_n} + \frac{v_1^2}{2g_n} = Z_2 + \frac{P_2}{\rho_2 g_n} + \frac{v_2^2}{2g_n} + h_L$$

All practical formulas for the flow of fluids are derived from Bernoulli's theorem, with modifications to account for losses due to friction.

Measurement of Pressure

Figure 1-5 graphically illustrates the relationship between gauge and absolute pressures. Perfect vacuum cannot exist on the surface of the earth, but it nevertheless makes a convenient datum for the measurement of pressure.

*Barometric pressure* is the level of the atmospheric pressure above perfect vacuum.

"Standard" atmospheric pressure is 1.013 25 bar (14.6959 lbf/in<sup>2</sup>) or 760 millimetres of mercury.

*Gauge pressure* is measured above atmospheric pressure, while absolute pressure always refers to perfect vacuum as a base.

*Vacuum* is the depression of pressure below the atmospheric level. Reference to vacuum conditions is often made by expressing the absolute pressure in terms of the height of a column of mercury or of water. Millimetre of mercury, micrometre (micron) of mercury, inch of water and inch of mercury, are some of the commonly used conventional units.

Figure 1-5

## Darcy's Formula

### General Equation for Flow of Fluids

Flow in pipe is always accompanied by friction of fluid particles rubbing against one another, and consequently, by loss of energy available for work; in other words, there must be a pressure drop in the direction of flow. If ordinary Bourdon tube pressure gauges were connected to a pipe containing a flowing fluid, as shown in Figure 1-6, gauge  $P_1$  would indicate a higher static pressure than gauge  $P_2$ .

Figure 1-6

The general equation for pressure drop, known as Darcy's formula and expressed in metres of fluid, is  $h_L = fLv^2/D 2g_n$ . This equation may be written to express pressure drop in newtons per square metre (pascals) by substitution of proper units, as follows:

$$\Delta P = \frac{\rho f L v^2}{2 D} \quad (\text{since } \Delta P = h_L \times \rho \times g_n) \quad \text{Equation 1-4}$$

For other forms of this equation, see page 3-2

The Darcy equation is valid for laminar or turbulent flow of any liquid in a pipe. However, when extreme velocities occurring in a pipe cause the downstream pressure to fall to the vapour pressure of the liquid, cavitation occurs and calculated flow rates will be inaccurate. With suitable restrictions, the Darcy equation may be used when gases and vapours (compressible fluids) are being handled. These restrictions are defined on page 1-7.

Equation 1-4 gives the loss in pressure due to friction and applies to pipe of constant diameter carrying fluids of reasonably constant density in straight pipe, whether horizontal, vertical, or sloping. For inclined pipe, vertical pipe, or pipe of varying diameter, the change in pressure due to changes in elevation, velocity, and density of the fluid must be made in accordance with Bernoulli's theorem (page 1-5). For an example using this theorem, see page 4-8.

**Friction factor:** The Darcy formula can be rationally derived by dimensional analysis, with the exception of the friction factor,  $f$ , which must be determined experimentally. The friction factor for laminar flow conditions ( $R_e < 2000$ ) is a function of Reynolds number only; whereas, for turbulent flow ( $R_e > 4000$ ), it is also a function of the character of the pipe wall.

A region known as the "critical zone" occurs between Reynolds number of approximately 2000 and 4000. In this region, the flow may be either laminar or turbulent depending upon several factors; these include changes in section or direction of flow and obstructions, such as valves, in the upstream piping. The friction factor in this region is indeterminate and has lower limits based on laminar flow and upper limits based on turbulent flow conditions.

At Reynolds numbers above approximately 4000, flow

conditions again become more stable and definite friction factors can be established. This is important because it enables the engineer to determine the flow characteristics of any fluid flowing in a pipe, providing the viscosity and density at flowing conditions are known. For this reason, Equation 1-4 is recommended in preference to some of the commonly known empirical equations for the flow of water, oil, and other liquids, as well as for the flow of compressible fluids when restrictions previously mentioned are observed.

If the flow is laminar ( $R_e < 2000$ ), the friction factor may be determined from the equation:

$$f = \frac{64}{R_e} = \frac{64 \mu'}{D v \rho} = \frac{64 \mu}{d v \rho}$$

If this quantity is substituted into Equation 1-4, the pressure drop in newtons per square metre is:

$$\Delta P = 32\,000 \frac{\mu L v}{d^2} \quad \text{Equation 1-5}$$

which is Poiseuille's law for laminar flow.

When the flow is turbulent ( $R_e > 4000$ ), the friction factor depends not only upon the Reynolds number but also upon the relative roughness,  $\epsilon/d$  . . . the roughness of the pipe walls ( $\epsilon$ ), as compared to the diameter of the pipe ( $d$ ). For very smooth pipes such as drawn brass tubing and glass, the friction factor decreases more rapidly with increasing Reynolds number than for pipe with comparatively rough walls.

Since the character of the internal surface of commercial pipe is practically independent of the diameter, the roughness of the walls has a greater effect on the friction factor in the small sizes. Consequently, pipe of small diameter will approach the very rough condition and, in general, will have higher friction factors than large pipe of the same material.

The most useful and widely accepted data of friction factors for use with the Darcy formula have been presented by L. F. Moody<sup>18</sup> and are reproduced on pages A-23 to A-25. Professor Moody improved upon the well-established Pigott and Kemler<sup>25, 26</sup> friction factor diagram, incorporating more recent investigations and developments of many outstanding scientists.

The friction factor,  $f$ , is plotted on page A-24 on the basis of relative roughness obtained from the chart on page A-23 and the Reynolds number. The value of  $f$  is determined by horizontal projection from the intersection of the  $\epsilon/d$  curve under consideration with the calculated Reynolds number to the left hand vertical scale of the chart on page A-24. Since most calculations involve

## Darcy's Formula

### General Equation for Flow of Fluids — continued

commercial steel or wrought iron pipe, the chart on page A-25 is furnished for a more direct solution. It should be kept in mind that these figures apply to clean new pipe.

**Effect of age and use on pipe friction:** Friction loss in pipe is sensitive to changes in diameter and roughness of pipe. For a given rate of flow and a fixed friction factor, the pressure drop per metre of pipe varies inversely with the fifth power of the diameter. Therefore, a 2% reduction of diameter causes an 11% increase in pressure drop; a 5% reduction of diameter increases pressure drop 29%. In

many services, the interior of pipe becomes encrusted with scale, dirt, tubercules or other foreign matter; thus, it is often prudent to make allowance for expected diameter changes.

Authorities<sup>2</sup> point out that roughness may be expected to increase with use (due to corrosion or incrustation) at a rate determined by the pipe material and nature of the fluid. Ippen<sup>18</sup>, in discussing the effect of aging, cites a 4-inch galvanized steel pipe which had its roughness doubled and its friction factor increased 20% after three years of moderate use.

## Principles of Compressible Flow in Pipe

An accurate determination of the pressure drop of a compressible fluid flowing through a pipe requires a knowledge of the relationship between pressure and specific volume; this is not easily determined in each particular problem. The usual extremes considered are adiabatic flow ( $P'V_a^\gamma = \text{constant}$ ) and isothermal-flow ( $P'V_a = \text{constant}$ ). Adiabatic flow is usually assumed in short, perfectly insulated pipe. This would be consistent since no heat is transferred to or from the pipe, except for the fact that the minute amount of heat generated by friction is added to the flow.

Isothermal flow or flow at constant temperature is often assumed, partly for convenience but more often because it is closer to fact in piping practice. The most outstanding case of isothermal flow occurs in natural gas pipe lines. Dodge and Thompson<sup>1</sup> show that gas flow in insulated pipe is closely approximated by isothermal flow for reasonably high pressures.

Since the relationship between pressure and volume may follow some other relationship ( $P'V_a^n = \text{constant}$ ) called polytropic flow, specific information in each individual case is almost an impossibility.

The density of gases and vapours changes considerably

with changes in pressure; therefore, if the pressure drop between  $P_1$  and  $P_2$  in Figure 1-6 is great, the density and velocity will change appreciably.

When dealing with compressible fluids, such as air, steam, etc., the following restrictions should be observed in applying the Darcy formula:

1. If the calculated pressure drop ( $P_1 - P_2$ ) is less than about 10% of the inlet pressure  $P_1$ , reasonable accuracy will be obtained if the specific volume used in the formula is based upon either the upstream or downstream conditions, whichever are known.
2. If the calculated pressure drop ( $P_1 - P_2$ ) is greater than about 10%, but less than about 40% of inlet pressure  $P_1$ , the Darcy equation may be used with reasonable accuracy by using a specific volume based upon the average of upstream and downstream conditions; otherwise, the method given on page 1-9 may be used.
3. For greater pressure drops, such as are often encountered in long pipe lines, the methods given on the next two pages should be used.

*(continued on the next page)*

## Principles of Compressible Flow in Pipe — continued

**Complete isothermal equation:** The flow of gases in long pipe lines closely approximates isothermal conditions. The pressure drop in such lines is often large relative to the inlet pressure, and solution of this problem falls outside the limitations of the Darcy equation. An accurate determination of the flow characteristics falling within this category can be made by using the complete isothermal equation:

$$w^2 = \left[ \bar{V}_1 \left( \frac{fL}{D} + 2 \log_e \frac{P'_1}{P'_2} \right) \right] \left[ \frac{(P'_1)^2 - (P'_2)^2}{P'_1} \right] \quad \text{Equation 1-6}$$

The formula is developed on the basis of these assumptions:

1. Isothermal flow.
2. No mechanical work is done on or by the system.
3. Steady flow or discharge unchanged with time.
4. The gas obeys the perfect gas laws.
5. The velocity may be represented by the average velocity at a cross section.
6. The friction factor is constant along the pipe.
7. The pipe line is straight and horizontal between end points.

**Simplified Compressible Flow—Gas Pipe Line Formula:** In the practice of gas pipe line engineering, another assumption is added to the foregoing:

8. Acceleration can be neglected because the pipe line is long.

Then, the formula for discharge in a horizontal pipe may be written:

$$w^2 = \left[ \frac{DA^2}{\bar{V}_1 fL} \right] \left[ \frac{(P'_1)^2 - (P'_2)^2}{P'_1} \right] \quad \text{Equation 1-7}$$

This is equivalent to the complete isothermal equation if the pipe line is long and also for shorter lines if the ratio of pressure drop to initial pressure is small.

Since gas flow problems are usually expressed in terms of cubic metres per hour at standard conditions, it is convenient to rewrite Equation 1-7 as follows:

$$q'_h = 1.361 \times 10^{-7} \sqrt{\frac{(P'_1)^2 - (P'_2)^2}{f L_m T S_g}} d^5 \quad \text{Equation 1-7a}$$

**Other commonly used formulas for compressible flow in long pipe lines:**

Weymouth formula<sup>24</sup>:

$$q'_h = 2.61 \times 10^{-8} d^{2.667} \sqrt{\frac{(P'_1)^2 - (P'_2)^2}{S_g L_m}} \frac{288}{T} \quad \text{Equation 1-8}$$

Panhandle formula<sup>3</sup> for natural gas pipe lines 6 to 24-inch diameter, Reynolds numbers  $5 \times 10^4$  to  $14 \times 10^6$ , and  $S_g = 0.6$ :

$$q'_h = 2.044 \times 10^{-8} E d^{2.6182} \left[ \frac{(P'_1)^2 - (P'_2)^2}{L_m} \right]^{0.5394} \quad \text{Equation 1-9}$$

The flow efficiency factor  $E$  is defined as an experience factor and is usually assumed to be 0.92 or 92% for average operating conditions. Suggested values for  $E$  for other operating conditions are given on page 3-3.

**Note:** The pressures  $P'_1, P'_2$  in all the foregoing equations are in terms of newtons per square metre. For equations in terms of pressures in bars,  $p'_1, p'_2$  refer to page 3-3.

**Comparison of formulas for compressible flow in pipe lines:** Equations 1-7, 1-8, and 1-9 are derived from the same basic formula, but differ in the selection of data used for the determination of the friction factors.

Friction factors in accordance with the Moody<sup>15</sup> diagram are normally used with the Simplified Compressible Flow formula (Equation 1-7). However, if the same friction factors employed in the Weymouth or Panhandle formulas are used in the Simplified formula, identical answers will be obtained.

The Weymouth friction factor<sup>24</sup> is defined as:

$$f = \frac{0.094}{d^{1/3}}$$

This is identical to the Moody friction factor in the fully turbulent flow range for 20-inch I.D. pipe only. Weymouth friction factors are greater than Moody factors for sizes less than 20-inch, and smaller for sizes larger than 20-inch.

The Panhandle friction factor<sup>3</sup> is defined as:

$$f = 0.0454 \left( \frac{d}{q'_h S_g} \right)^{0.1461}$$

In the flow range to which the Panhandle formula is limited, this results in friction factors that are lower than those obtained from either the Moody data or the Weymouth friction formula. As a result, flow rates obtained by solution of the Panhandle formula are usually greater than those obtained by employing either the Simplified Compressible Flow formula with Moody friction factors, or the Weymouth formula.

An example of the variation in flow rates which may be obtained for a specific condition by employing these formulas is given on page 4-11.

## Principles of Compressible Flow in Pipe — continued

**Limiting flow of gases and vapours:** The feature not evident in the preceding formulas (Equations 1-4 and 1-6 to 1-9 inclusive) is that the weight rate of flow (e.g. kg/sec) of a compressible fluid in a pipe, with a given upstream pressure will approach a certain maximum rate which it cannot exceed, no matter how much the downstream pressure is further reduced.

The maximum velocity of a compressible fluid in pipe is limited by the velocity of propagation of a pressure wave which travels at the speed of sound in the fluid. Since pressure falls off and velocity increases as fluid proceeds downstream in pipe of uniform cross section, the maximum velocity occurs in the downstream end of the pipe. If the pressure drop is sufficiently high, the exit velocity will reach the velocity of sound. Further decrease in the outlet pressure will not be felt upstream because the pressure wave can only travel at sonic velocity, and the "signal" will never translate upstream. The "surplus" pressure drop obtained by lowering the outlet pressure after the maximum discharge has already been reached takes place beyond the end of the pipe. This pressure is lost in shock waves and turbulence of the jetting fluid.

The maximum possible velocity in the pipe is sonic velocity, which is expressed as:

Equation 1-10

$$v_s = \sqrt{\gamma RT} = \sqrt{\gamma P' \bar{V}}$$

The value of  $\gamma$  the ratio of specific heats at constant pressure to constant volume, is 1.4 for most diatomic gases; see pages A-8 and A-9 for values of  $\gamma$  for gases and steam respectively. This velocity will occur at the outlet end or in a constricted area, when the pressure drop is sufficiently high. The pressure, temperature, and specific volume are those occurring at the point in question. When compressible fluids discharge from the end of a reasonably short pipe of uniform cross section into an area of larger cross section, the flow is usually considered to be adiabatic. This assumption is supported by experimental data on pipe having lengths of 220 and 130 pipe diameters discharging air to atmosphere. Investigation of the complete theoretical analysis of adiabatic flow<sup>19</sup> has led to a basis for establishing correction factors, which may be applied to the Darcy equation for this condition of flow.

Since these correction factors compensate for the changes in fluid properties due to expansion of the fluid, they are identified as  $Y$  net expansion factors; see page A-22.

The Darcy formula, including the  $Y$  factor, is:

$$w = 1.111 \times 10^{-6} Y d^2 \sqrt{\frac{\Delta P}{K \bar{V}_1}} \quad \text{Equation 1-11*}$$

(Resistance coefficient  $K$  is defined on page 2-8)

It should be noted that the value of  $K$  in this equation is the total resistance coefficient of the pipe line, including entrance and exit losses when they exist, and losses due to valves and fittings.

The pressure drop,  $\Delta P$ , in the ratio  $\Delta P/P'$ , which is used for the determination of  $Y$  from the charts on page A-22, is the measured difference between the inlet pressure and the pressure in the area of larger cross section. In a system discharging compressible fluids to atmosphere, this  $\Delta P$  is equal to the inlet gauge pressure, or the difference between absolute inlet pressure and atmospheric pressure. This value of  $\Delta P$  is also used in Equation 1-11, whenever the  $Y$  factor falls within the limits defined by the resistance factor  $K$  curves in the charts on page A-22. When the ratio of  $\Delta P/P'$ , using  $\Delta P$  as defined above, falls beyond the limits of the  $K$  curves in the charts, sonic velocity occurs at the point of discharge or at some restriction within the pipe, and the limiting values for  $Y$  and  $\Delta P$ , as determined from the tabulations to the right of the charts on page A-22, must be used in Equation 1-11.

Application of Equation 1-11 and the determination of values for  $K$ ,  $Y$ , and  $\Delta P$  in the formula is demonstrated in examples on pages 4-13 and 4-14.

The charts on page A-22 are based upon the general gas laws for perfect gases and, at sonic velocity conditions at the outlet end, will yield accurate results for all gases which approximately follow the perfect gas laws. An example of this type of flow problem is presented on page 4-13.

This condition of flow is comparable to the flow through nozzles and venturi tubes, covered on page 2-15, and the solutions of such problems are similar.

\*For equation in terms of pressure drop in bars ( $\Delta p$ ) see page 3-4.

## Steam

### General Discussion

Water under normal atmospheric conditions exists in the form of a liquid. When a body of water is heated by means of some external medium, the temperature of the water rises and soon small bubbles, which break and form continuously, are noted on the surface. This phenomenon is described as "boiling".

There are three distinct stages in the process of converting water to superheated steam. The water must be boiling before steam can be formed and superheated steam cannot be formed until the steam has been completely dried.

In stage one, heat is added to raise the temperature of the water to the boiling point corresponding to the pressure conditions under which the heat is added. The boiling point is usually referred to as the generation or saturation temperature. The amount of heat required to raise the temperature of the water from 0°C to the saturation temperature is known as the enthalpy of the water or sensible heat.

In the second stage heat is added to the boiling water and under constant pressure conditions the water is changed to steam without any increase in temperature. This is the evaporation or latent heat stage. At this stage, with the steam in contact with liquid water, the steam is in the condition known as Saturated. It may be "dry" or "wet" depending on the generating conditions. "Dry" saturated steam is steam free from mechanically mixed water particles. "Wet" saturated steam contains water particles in suspension. Saturated steam at any pressure has a definite temperature.

If the water is heated in a closed vessel not completely filled, the pressure will rise after steam begins to form accompanied by an increase in temperature.

Stage three commences when steam at any given pressure is heated to a temperature higher than the temperature of saturated steam at that pressure. The steam is then said to be Superheated.

Heat is one of the forms of energy and the SI unit for all forms is the joule (J). This is a very small unit of energy and it is often more convenient to use the kilojoule (kJ) or even larger multiple, megajoule (MJ).

The SI unit for energy per unit mass is the joule per kilogram (J/kg) or some multiple of this unit and the steam tables provided on pages A-13 to A-17 give detailed information on the specific enthalpy of steam, in terms of kilojoules per kilogram (kJ/kg), over a wide range of pressure and temperature conditions. The datum is taken as 0°C. From the table on page A-13 the specific enthalpy (sensible heat) of water at 1 bar absolute is seen to be 417.5 kJ/kg and the specific enthalpy of evaporation (latent heat) 2257.9 kJ/kg. Consequently, the total heat or energy of the vapour, formed when water boils at 1 bar pressure is the sum of these two quantities, i.e. 2675.4 kJ/kg.

The relationship between the joule and the British thermal unit (Btu) is defined by the equation:

$$1 \text{ Btu/lb} = 2.326 \text{ J/g} = 2.326 \text{ kJ/kg}$$

# Flow of Fluids Through Valves and Fittings

## CHAPTER 2

The preceding chapter has been devoted to the theory and formulas used in the study of fluid flow in pipes. Since industrial installations usually contain a considerable number of valves and fittings, a knowledge of their resistance to the flow of fluids is necessary to determine the flow characteristics of a complete piping system.

Many texts on hydraulics contain no information on the resistance of valves and fittings to flow, while others present only a limited discussion of the subject. In realization of the need for more complete detailed information on the resistance of valves and fittings to flow, Crane Co. has conducted extensive tests in their Engineering Laboratories and has also sponsored investigations in other laboratories. These tests have been supplemented by a thorough study of all published data on this subject. Appendix A contains data from these many separate tests and the findings have been combined to furnish a basis for calculating the pressure drop through valves and fittings.

Representative resistances to flow of various types of piping components are given in the "K" Factor Table; see pages A-26 thru A-29.

The chart on page A-30 illustrates the relationship between equivalent length in pipe diameters and in metres of pipe for flow in the zone of complete turbulence, resistance coefficient  $K$ , and pipe size.

A discussion of the equivalent length and resistance coefficient  $K$ , as well as the flow coefficient  $C_v$  methods of calculating pressure drop through valves and fittings is presented on pages 2-8 to 2-10.

### Types of Valves and Fittings used in Pipe Systems

**Valves:** The great variety of valve designs precludes any thorough classification.

If valves were classified according to the resistance they offer to flow, those exhibiting a straight-thru flow path such as gate, ball, plug, and butterfly valves would fall in the low resistance class, and those having a change in flow path direction such as globe and angle valves would fall in the high resistance class.

For photographic illustrations of some of the most commonly used valve designs, refer to pages A-18 and A-19. For line illustrations of typical fittings and pipe bends, as well as valves, see pages A-27 to A-29.

**Fittings:** Fittings may be classified as branching, reducing, expanding, or deflecting. Such fittings as tees, crosses, side outlet elbows, etc., may be called branching fittings.

Reducing or expanding fittings are those which change the area of the fluid passageway. In this class are reducers and bushings. Deflecting fittings.....bends, elbows, return bends, etc. ....are those which change the direction of flow.

Some fittings, of course, may be combinations of any of the foregoing general classifications. In addition, there are types such as couplings and unions which offer no appreciable resistance to flow and, therefore, need not be considered here.

### Pressure Drop Chargeable To Valves and Fittings

When a fluid is flowing steadily in a long straight pipe of uniform diameter, the flow pattern, as indicated by the velocity distribution across the pipe diameter, will assume a certain characteristic form. Any impediment in the pipe which changes the direction of the whole stream, or even part of it, will alter the characteristic flow pattern and create turbulence, causing an energy loss greater than that normally accompanying flow in straight pipe. Because valves and fittings in a pipeline disturb the flow pattern, they produce an additional pressure drop.

The loss of pressure produced by a valve (or fitting) consists of:

1. The pressure drop within the valve itself.
2. The pressure drop in the upstream piping in excess of that which would normally occur if there were no valve in the line. This effect is small.
3. The pressure drop in the downstream piping in excess of that which would normally occur if there were no valve in the line. This effect may be comparatively large.

From the experimental point of view it is difficult to measure the three items separately. Their combined effect is the desired quantity, however, and this can be accurately measured by well known methods.

Figure 2-1

Figure 2-1 shows two sections of a pipe line of the same diameter and length. The upper section contains a globe valve. If the pressure drops,  $\Delta P_1$  and  $\Delta P_2$ , were measured between the points indicated, it would be found that  $\Delta P_1$  is greater than  $\Delta P_2$ .

Actually, the loss chargeable to a valve of length "d" is  $\Delta P_1$  minus the loss in a section of pipe of length "a + b". The losses, expressed in terms of resistance coefficient "K" of various valves and fittings as given on pages A-26 to A-29 include the loss due to the length of the valve or fitting.

Crane Flow Tests

Crane Engineering Laboratories have facilities for conducting water, steam, and air flow tests for many sizes and types of valves and fittings. Although a detailed discussion of all the various tests performed is beyond the scope of this paper, a brief description of some of the apparatus will be of interest.

The test piping shown in Figure 2-3 is unique in that 150 mm (6 inch) gate, globe, and angle valves or 90 degree ells and tees can be tested with either water or steam. The vertical leg of the angle test section permits testing of angle lift check and stop check valves.

Saturated steam at 10 bar is available at flow rates up to 50 000 kilograms/hour. The steam is throttled to the desired pressure and its state is determined at the meter as well as upstream and downstream from the test specimen.

For tests on water, a steam-turbine driven pump supplies water at rates up to 4.5 cubic metres/minute through the test piping.

Static pressure differential is measured by means of a manometer connected to piezometer rings upstream and downstream from test position 1 in the angle test section, or test position 2 in the straight test section. The downstream piezometer for the angle test section serves as the upstream piezometer for the straight test

Figure 2-2

angle valve

section. Measured pressure drop for the pipe alone between piezometer stations is subtracted from the pressure drop through the valve plus pipe to ascertain the pressure drop chargeable to the valve alone.

Results of some of the flow tests conducted in the Crane Engineering Laboratories are plotted in Figures 2-4 to 2-7 shown on the two pages following.

### Relationship of Pressure Drop to Velocity of Flow

Many experiments have shown that the head loss due to valves and fittings is proportional to a constant power of the velocity. When pressure drop or head loss is plotted against velocity on logarithmic co-ordinates, the resulting curve is therefore a straight line. In the turbulent flow range, the value of the exponent of  $v$  has been found to vary from about 1.8 to 2.1 for different designs of valves and fittings. However, for all practical purposes, it can be assumed that the pressure drop or head loss due to the flow of fluids in the turbulent range through valves and fittings varies as the square of the velocity.

This relationship of pressure drop to velocity of flow is valid for check valves, only if there is sufficient flow to hold the disc in a wide open position. The point of deviation of the test curves from a straight line, as illustrated in Figures 2-5 and 2-6, defines the flow conditions necessary to support a check valve disc in the wide open position.

Most of the difficulties encountered with check valves, both lift and swing types, have been found to be due to oversizing which results in noisy operation and premature wear of the moving parts.

Referring again to Figure 2-6, it will be noted that the velocity of 3.5 bar saturated steam, at the point where the two curves deviate from a straight line, is about 4000 to 4500 metres/minute. Lower velocities are not sufficient to lift the disc through its full stroke and hold it in a stable position against the stops, and can actually result in an increase in pressure drop as indicated by the curves. Under these conditions, the disc fluctuates with each minor flow pulsation, causing noisy operation and

Figure 2-11

Y-Pattern  
Swing Check Valve

Lift Check  
Valve

rapid wear of the contacting moving parts.

The minimum velocity required to lift the disc to the full-open and stable position has been determined by tests for numerous types of check and foot valves, and is given in the "K" Factor Table (see pages A-26 thru A-29). It is expressed in terms of a constant times the square root of the specific volume of the fluid being handled, making it applicable for use with any fluid.

Sizing of check valves in accordance with the specified minimum velocity for full disc lift will often result in valves smaller in size than the pipe in which they are installed; however, the actual pressure drop will be little, if any, higher than that of a full size valve which is used in other than the wide-open position. The advantages are longer valve life and quieter operation. The losses due to sudden or gradual contraction and enlargement which will occur in such installations with bushings, reducing flanges, or tapered reducers can be readily calculated from the data given in the "K" Factor Table.

Figure 2-12

Both water and steam tests are conducted on this set-up.

### Resistance Coefficient $K$ , Equivalent Length $L/D$ And Flow Coefficient

Pressure loss test data for a wide variety of valves and fittings are available from the work of numerous investigators. Extensive studies in this field have been conducted by Crane Laboratories. However, due to the time-consuming and costly nature of such testing, it is virtually impossible to obtain test data for every size and type of valve and fitting.

It is therefore desirable to provide a means of reliably extrapolating available test information to envelope those items which have not been or cannot readily be tested. Commonly used concepts for accomplishing this are the "equivalent length  $L/D$ "; "resistance coefficient  $K$ ", and "flow coefficient  $C_v$  or  $K_v$ ".

Pressure losses in a piping system result from a number of system characteristics, which may be categorized as follows:

1. Pipe friction, which is a function of the surface roughness of the interior pipe wall, the inside diameter of the pipe, and the fluid velocity, density and viscosity. Friction factors are discussed on pages 1-6 and 1-7. For friction data, see pages A-23 thru A-25.
2. Changes in direction of flow path.
3. Obstructions in flow path.
4. Sudden or gradual changes in the cross-section and shape of flow path.

Velocity in a pipe is obtained at the expense of static head, and decrease in static head due to velocity is,

$$h_L = \frac{v^2}{2g_n} \quad \text{Equation 2-1}$$

which is defined as the "velocity head". Flow through a valve or fitting in a pipe line also causes a reduction in static head which may be expressed in terms of velocity head. The resistance coefficient  $K$  in the equation

$$h_L = K \frac{v^2}{2g_n} \quad \text{Equation 2-2}$$

therefore, is defined as the number of velocity heads lost due to a valve or fitting. It is always associated with the diameter in which the velocity occurs. In most valves or fittings, the losses due to friction (Category 1 above) resulting from actual length of flow path are minor compared to those due to one or more of the other three categories listed.

The resistance coefficient  $K$  is therefore considered as being independent of friction factor or Reynolds number, and may be treated as a constant for any given obstruction (i.e., valve or fitting) in a piping system under all conditions of flow, including laminar flow.

The same loss in straight pipe is expressed by the Darcy equation

$$h_L = \left( f \frac{L}{D} \right) \frac{v^2}{2g_n} \quad \text{Equation 2-3}$$

It follows that

$$K = \left( f \frac{L}{D} \right) \quad \text{Equation 2-4}$$

The ratio  $L/D$  is the equivalent length, in pipe diameters of straight pipe, that will cause the same pressure drop as the obstruction under the same flow conditions. Since the resistance coefficient  $K$  is constant for all conditions of flow, the value of  $L/D$  for any given valve or fitting must necessarily vary inversely with the change in friction factor for different flow conditions.

The resistance coefficient  $K$  would theoretically be a constant for all sizes of a given design or line of valves and fittings if all sizes were geometrically similar. However, geometric similarity is seldom, if ever, achieved because the design of valves and fittings is dictated by manufacturing economies, standards, structural strength, and other considerations.

Figure 2-13  
Geometrical dissimilarity between 50 mm (2 inch) and 300 mm (12 inch) standard cast iron flanged elbows

An example of geometric dissimilarity is shown in Figure 2-13 where a 300 mm (12 inch) standard elbow has been drawn to 1/6 scale of a 50 mm (2 inch) standard elbow, so that their port diameters are identical. The flow paths through the two fittings drawn to these scales would also have to be identical to have geometric similarity; in addition, the relative roughness of the surfaces would have to be similar.

Figure 2-14 is based on the analysis of extensive test data from various sources. The  $K$  coefficients for a number of lines of valves and fittings have been plotted against size. It will be noted that the  $K$  curves show a definite tendency to follow the same slope as the

\* $f_T$  = friction factor for flow in the zone of complete turbulence: see page A-26.

(continued from the preceding page)

$f(L/D)$  curve for straight clean commercial steel pipe at flow conditions resulting in a constant friction factor. It is probably coincidence that the effect of geometric dissimilarity between different sizes of the same line of valves or fittings upon the resistance coefficient  $K$  is similar to that of relative roughness, or size of pipe, upon friction factor.

Based on the evidence presented in Figure 2-14, it can be said that the resistance coefficient  $K$ , for a given line of valves or fittings, tends to vary with size as does the friction factor,  $f$ , for straight clean commercial steel pipe at flow conditions resulting in a constant friction factor, and that the equivalent length  $L/D$

tends toward a constant for the various sizes of a given line of valves or fittings at the same flow conditions.

On the basis of this relationship, the resistance coefficient  $K$  for each illustrated type of valve and fitting is presented on pages A-26 thru A-29. These coefficients are given as the product of the friction factor for the desired size of clean commercial steel pipe with flow in the zone of complete turbulence, and a constant, which represents the equivalent length  $L/D$  for the valve or fitting in pipe diameters for the same flow conditions, on the basis of test data. This equivalent length, or constant, is valid for all sizes of the valve or fitting type with which it is identified.

**Resistance Coefficient  $K$ , Equivalent Length  $L/D$ ,  
And Flow Coefficient - continued**

The friction factors for clean commercial steel pipe with flow in the zone of complete turbulence ( $f_T$ ), for nominal sizes from ½ to 24-inch (15 to 600 mm), are tabulated at the beginning of the “ $K$ ” Factor Table (page A-26) for convenience in converting the algebraic expressions of  $K$  to arithmetic quantities.

There are some resistances to flow in piping, such as sudden and gradual contractions and enlargements, and pipe entrances and exits, that have geometric similarity between sizes. The resistance coefficients ( $K$ ) for these items are therefore independent of size as indicated by the absence of a friction factor in their values given in the “ $K$ ” Factor Table.

As previously stated, the resistance coefficient  $K$  is always associated with the diameter in which the velocity in the term  $v^2/2g_n$  occurs. The values in the “ $K$ ” Factor Table are associated with the internal diameter of the following pipe schedule numbers for the various ANSI Classes of valves and fittings.

Class 300 and lower. . . . .	Schedule 40
Class 400 and 600. . . . .	Schedule 80
Class 900. . . . .	Schedule 120
Class 1500. . . . .	Schedule 160
Class 2500 (sizes ½ to 6") . . . . .	XXS
Class 2500 (sizes 8" and up). . . . .	Schedule 160

When the resistance coefficient  $K$  is used in flow equation 2-2, or any of its equivalent forms given in Chapter 3 as Equations 3-14, 3-16, 3-19 and 3-20, the velocity and internal diameter dimensions used in the equation must be based on the dimensions of these schedule numbers regardless of the pipe with which the valve may be installed.

An alternate procedure which yields identical results for Equation 2-2 is to adjust  $K$  in proportion to the fourth power of the diameter ratio, and to base values of velocity or diameter on the internal diameter of the connecting pipe.

$$K_a = K_b \left( \frac{d_a}{d_b} \right)^4 \tag{Equation 2-5}$$

Subscript “ $a$ ” defines  $K$  and  $d$  with reference to the internal diameter of the connecting pipe.

Subscript “ $b$ ” defines  $K$  and  $d$  with reference to the internal diameter of the pipe for which the values of  $K$  were established, as given in the foregoing list of pipe schedule numbers.

When a piping system contains more than one size of pipe, valves, or fittings, Equation 2-5 may be used to express all resistances in terms of one size. For this case, subscript “ $a$ ” relates to the size with reference to which all resistances are to be expressed, and subscript “ $b$ ” relates to any other size in the system. For sample problem, see Example 4-14.

It is convenient in some branches of the valve industry, particularly in connection with control valves, to express the valve capacity and the valve flow characteristics in terms of a flow coefficient. In the USA and UK the flow coefficient at present in use is designated  $C_v$  and is defined as:

$C_v$  = Rate of flow of water, in either US or UK gallons per minute, at 60F, at a pressure drop of one pound per square inch across the valve. (See Equation 3-16, page 3-4).

Another coefficient,  $K_v$ , is used in some countries, particularly in Europe, and this is defined as:

$K_v$  = Rate of flow of water in cubic metres per hour ( $m^3/h$ ) at a pressure drop of one kilogram force per square centimetre ( $kgf/cm^2$ ) across the valve.

One  $kgf/cm^2$  is equal to 0.980 665 bar (exactly) and in some continental countries the name kilopond (kp) is used in place of kilogram force, i.e.  $1 kp/cm^2 = 1 kgf/cm^2$ .

At the time of preparation of this paper there is no agreed international definition for a flow coefficient in terms of SI units. Liquid flow capacity in metric units can be converted to  $C_v$  as defined above. For example:

$$C_v = 0.0694 Q \sqrt{\frac{\rho}{\Delta p (999)}} \text{ (in U.S. gallons)}$$

where:

- $Q$  = rate of flow, litres/min.
- $\rho$  = density of fluid,  $kg/m^3$
- $\Delta p$  = bar

Laminar Flow Conditions

In the usual piping installation, the flow will change from laminar to turbulent in the range of Reynolds numbers from 2000 to 4000, defined on pages A-24 and A-25 as the critical zone. The lower critical Reynolds number of 2000 is usually recognized as the upper limit for the application of Poiseuille's law for laminar flow in straight pipes,

$$h_L = 3263 \left( \frac{\mu L v}{d^2 \rho} \right) \tag{Equation 2-8}$$

which is identical to Equation 2-3 when the value of the friction factor for laminar flow,  $f = 64/R_e$ , is

factored into it. Laminar flow at Reynolds numbers above 2000 is unstable, and the critical zone and lower range of the transition zone, turbulent mixing and laminar motion may alternate unpredictably.

Equation 2-2 ( $h_L = K v^2 / 2g_n$ ) is valid for computing the head loss due to valves and fittings for all conditions of flow, including laminar flow, using resistance coefficient  $K$  as given in the "K" Factor Table. When this equation is used to determine the losses in straight pipe, it is necessary to compute the Reynolds number in order to establish the friction factor,  $f$ , to be used to determine the value of the resistance coefficient  $K$  for the pipe in accordance with Equation 2-4 ( $K = fL/D$ ). See examples on pages 4-4 and 4-5.

Contraction and Enlargement

The resistance to flow due to sudden enlargements may be expressed by,

$$K_1 = \left( 1 - \frac{d_1^2}{d_2^2} \right)^2 \tag{Equation 2-9}$$

and the resistance due to sudden contractions, by

$$K_1 = 0.5 \left( 1 - \frac{d_1^2}{d_2^2} \right) \tag{Equation 2-10}$$

Subscripts 1 and 2 define the internal diameters of the small and large pipes respectively.

It is convenient to identify the ratio of diameters of the small to large pipes by the Greek letter  $\beta$  (beta). Using this notation, these equations may be written,

Sudden Enlargement

$$K_1 = (1 - \beta^2)^2 \tag{Equation 2-9.1}$$

Sudden Contraction

$$K_1 = 0.5(1 - \beta^2) \tag{Equation 2-10.1}$$

Equation 2-9 is derived from the momentum equation together with the Bernoulli equation. Equation 2-10 uses the derivation of Equation 2-9 together with the continuity equation and a close approximation of the contraction coefficients determined by Julius Weisbach.<sup>28</sup>

The value of the resistance coefficient in terms of the larger pipe is determined by dividing Equations 2-9 and 2-10 by  $\beta^4$ .

$$K_2 = \frac{K_1}{\beta^4} \tag{Equation 2-11}$$

The losses due to gradual enlargements in pipes were investigated by A.H. Gibson,<sup>29</sup> and may be expressed as a coefficient,  $C_e$ , applied to Equation 2-9. Approximate averages of Gibson's coefficients for different included angles of divergence,  $\theta$ , are defined by the equations:

$$\text{For } \theta \leq 45^\circ \dots \dots \dots C_e = 2.6 \sin \frac{\theta}{2} \tag{Equation 2-12}$$

$$\text{For } 45^\circ < \theta \leq 180^\circ \dots \dots C_e = 1 \tag{Equation 2-12.1}$$

The losses due to gradual contractions in pipes were established by the analysis of Crane test data, using the same basis as that of Gibson for gradual enlargements, to provide a contraction coefficient,  $C_c$  to be applied to Equation 2-10. The approximate averages of these coefficients for different included angles of convergence,  $\theta$ , are defined by the equations:

$$\text{For } \theta \leq 45^\circ \dots \dots \dots C_c = 1.6 \sin \frac{\theta}{2} \tag{Equation 2-13}$$

$$\text{For } 45^\circ < \theta \leq 180^\circ \dots \dots C_c = \sqrt{\sin \frac{\theta}{2}} \tag{Equation 2-13.1}$$

The resistance coefficient  $K$  for sudden and gradual enlargements and contractions, expressed in terms of the large pipe, is established by combining equations 2-9 to 2-13 inclusive.

Sudden and Gradual Enlargements

Equation 2-14

$$\theta \leq 45^\circ \dots \dots \dots K_2 = \frac{2.6 \sin \frac{\theta}{2} (1 - \beta^2)^2}{\beta^4} \tag{Equation 2-14.1}$$

$$45^\circ < \theta \leq 180^\circ \dots \dots \dots K_2 = \frac{(1 - \beta^2)^2}{\beta^4}$$

Sudden and Gradual Contractions

Equation 2-15

$$\theta \leq 45^\circ \dots \dots \dots K_2 = \frac{0.8 \sin \frac{\theta}{2} (1 - \beta^2)}{\beta^4} \tag{Equation 2-15.1}$$

$$45^\circ < \theta \leq 180^\circ \dots \dots \dots K_2 = \frac{0.5 \sqrt{\sin \frac{\theta}{2}} (1 - \beta^2)}{\beta^4}$$

### Valves with Reduced Seats

Valves are often designed with reduced seats, and the transition from seat to valve ends may be either abrupt or gradual. Straight-through types, such as gate and ball valves, so designed with gradual transition are sometimes referred to as venturi valves. Analysis of tests on such straight-through valves indicates an excellent correlation between test results and calculated values of  $K$  based on the summation of Equations 2-11, 2-14 and 2-15.

Valves which exhibit a change in direction of the flow path, such as globe and angle valves, are classified as high resistance valves. Equations 2-14 and 2-15 for gradual contractions and enlargements cannot be readily applied to these configurations because the angles of convergence and divergence are variable with respect to different planes of reference. The entrance and exit losses for reduced seat globe and angle valves are judged to fall short of those due to sudden expansion and contraction (Equations 2-14.1 and 2-15.1 at  $\theta = 180^\circ$ ) if the approaches to the seat are gradual. Analysis of available test data indicates that the factor  $\beta$  applied to Equations 2-14 and 2-15 for sudden contraction and enlargement will bring calculated  $K$  values for reduced

seat globe and angle valves into reasonably close agreement with test results. In the absence of actual test data, the resistance coefficients for reduced seat globe and angle valves may thus be computed as the summation of Equation 2-11 and  $\beta$  times Equations 2-14.1 and 2-15.1 at  $\theta = 180^\circ$ .

The procedure for determining  $K$  for reduced seat globe and angle valves is also applicable to throttled globe and angle valves. For this case the value of  $\beta$  must be based upon the square root of the ratio of areas,

$$\beta = \sqrt{\frac{a_1}{a_2}}$$

where:

$a_1$  . . . . . defines the area at the most restricted point in the flow path

$a_2$  . . . . . defines the internal area of the connecting pipe.

### Resistance of Bends

**Secondary flow:** The nature of the flow of liquids in bends has been thoroughly investigated and many interesting facts have been discovered. For example, when a fluid passes around a bend in either viscous or turbulent flow, there is established in the bend a condition known as "secondary flow". This is rotating motion, at right angles to the pipe axis, which is superimposed upon the main motion in the direction of the axis. The frictional resistance of the pipe walls and the action of centrifugal force combine to produce this rotation. Figure 2-15 illustrates this phenomenon.

**Resistance of bends to flow:** The resistance or head loss in a bend is conventionally assumed to consist of — (1) the loss due to curvature; (2) the excess loss in the downstream tangent; and (3) the loss due to length, thus:

Figure 2-15  
Secondary Flow in Bends

$$h_t = h_p + h_e + h_L \quad \text{Equation 2-16}$$

where:

$h_t$  = total loss, in metres of fluid

$h_p$  = excess loss in downstream tangent, in metres of fluid

$h_c$  = loss due to curvature, in metres of fluid

$h_L$  = loss in bend due to length, in metres of fluid

if:

$$h_b = h_p + h_c \quad \text{Equation 2-17}$$

then:

$$h_t = h_b + h_L$$

However, the quantity  $h_b$  can be expressed as a function of velocity head in the formula:

$$h_b = K_b \frac{v^2}{2g_n} \quad \text{Equation 2-18}$$

where:

$K_b$  = the bend coefficient

$v$  = velocity through pipe, metres per second

$g_n$  = 9.81 metres per second per second

Resistance of Bends — continued

Figure 2-16, Bend Coefficients Found by Various Investigators (Beij<sup>21</sup>)  
 From "Pressure Losses for Fluid Flow in 90° Pipe Bends" by K.H. Beij  
 Courtesy of Journal of Research of National Bureau of Standards

Investigator	Diameter inches	Symbol	Diameter mm
Balch	3	●	80
Davis	2	○	50
Brightmore	3	■	80
Brightmore	4	□	100
Hofmann	1.7	▲	43
Hofmann	1.7 (rough pipe)	△	43 (rough pipe)
Hofmann	1.7 (smooth pipe)	▽	43 (smooth pipe)
Vogel	6, 8 and 10	▼	150, 200, 250
Beij	4	◆	100

The relationship between  $K_b$  and  $r/d$  (relative radius\*) is not well defined, as can be observed by reference to Figure 2-16 (taken from the work of Beij<sup>21</sup>). The curves in this chart indicate that  $K_b$  has a minimum value when  $r/d$  is between 3 and 5.

Values of  $K$  for 90 degree bends with various bend ratios ( $r/d$ ) are listed on page A-29. The values (also based on the work of Beij) represent average conditions of flow in 90 degree bends.

The loss due to continuous bends greater than 90 degrees, such as pipe coils or expansion bends, is less than the summation of losses in the total number of 90 degree bends contained in the coil, considered separately, because the loss  $h_p$  in Equation 2-16 occurs only once in the coil.

The loss due to length in terms of  $K$  is equal to the developed length of the bend, in pipe diameters, multiplied by the friction factor  $f_T$  as previously described and as tabulated on page A-26.

$$K_{length} = .5 f_T \pi \left( \frac{l}{d} \right) \quad \text{Equation 2-19}$$

In the absence of experimental data, it is assumed that  $h_p = h_c$  in Equation 2-16. On this basis, the total value of  $K$  for a pipe coil or expansion bend made up of

continuous 90 degree bends can be determined by multiplying the number ( $n$ ) of 90 degree bends less one contained in the coil by the value of  $K$  due to length, plus one-half of the value of  $K$  due to bend resistance, and adding the value of  $K$  for one 90 degree bend (page A-29).

$$K_B = (n-1) (0.25 f_T \pi \frac{l}{d} + 0.5 K_1) + K_1 \quad \text{Equation 2-20}$$

Subscript 1 defines the value of  $K$  (see page A-29) for one 90 degree bend.

Example:

A 2" Schedule 40 pipe coil contains five complete turns, i.e., twenty ( $n$ ) 90 degree bends. The relative radius ( $r/d$ ) of the bends is 16, and the resistance coefficient  $K_1$  of one 90 degree bend is  $42f_T$  ( $42 \times .019 = .80$ ) per page A-29.

Find the total resistance coefficient ( $K_B$ ) for the coil.

$$K_B = (20-1) (0.25 \times 0.019 \pi \times 16 + 0.5 \times 0.8) + 0.8 = 13$$

Resistance of mitre bends: The equivalent length of mitre bends, based on the work of H. Kirchbach<sup>4</sup>, is also shown on page A-29.

\*The relative radius of a bend is the ratio of the radius of the bend axis to the internal diameter of the pipe. Both dimensions must be in the same units.

### Flow Through Nozzles and Orifices

Orifices and nozzles are used principally to meter rate of flow. A portion of the theory is covered here. For more complete data, refer to Bibliography sources 8, 9, and 10. For installation or operation of commercial meters, refer to information supplied by the meter manufacturer.

Orifices are also used to restrict flow or to reduce pressure. For liquid flow, several orifices are sometimes used to reduce pressure in steps so as to avoid cavitation. Overall resistance coefficient  $K$  for an orifice is given on page A-20. For a sample problem, see page 4-7.

The rate of flow of any fluid through an orifice or nozzle, neglecting the velocity of approach, may be expressed by:

$$q = C_d A \sqrt{2g_n h_L} \quad \text{Equation 2-21}$$

Velocity of approach may have considerable effect on the quantity discharged through a nozzle or orifice. The factor correcting for velocity of approach.

$$\frac{1}{\sqrt{1 - \beta^4}}$$

may be incorporated in Equation 2-21 as follows:

$$q = \frac{C_d A}{\sqrt{1 - \beta^4}} \sqrt{2g_n h_L} \quad \text{Equation 2-22}$$

The quantity

$$\frac{C_d}{\sqrt{1 - \beta^4}}$$

is defined as the flow coefficient  $C$ . Values of  $C$  for nozzles and orifices are shown on page A-20. Use of the flow coefficient  $C$  eliminates the necessity for calculating the velocity of approach, and Equation 2-22 may now be written:

$$q = CA \sqrt{2g_n h_L} = CA \sqrt{\frac{2 \Delta p}{\rho}} \quad \text{Equation 2-23}$$

Orifices and nozzles are normally used in piping systems as metering devices and are installed with flange taps or pipe taps in accordance with ASME or other standard specifications. The values of  $h_L$  and  $\Delta p$  in Equation 2-23 are the measured differential static head or pressure across pipe taps located 1 diameter upstream and 0.5 diameter downstream from the inlet face of the orifice plate or nozzle, when values of  $C$  are taken from page A-20. The flow coefficient  $C$  is plotted for Reynolds numbers based on the internal diameter of the upstream pipe.

**Flow of liquids:** For nozzles and orifices discharging incompressible fluids to atmosphere,  $C$  values may be taken from page A-20 if  $h_L$  or  $\Delta p$  in Equation 2-23 is taken as the upstream head or gauge pressure.

**Flow of gases and vapors:** The flow of compressible fluids through nozzles and orifices can be expressed by the same equation used for liquids except the net expansion factor  $Y$  must be included.

$$q = YCA \sqrt{\frac{2 \Delta p}{\rho}} \quad \text{Equation 2-24}$$

The expansion factor  $Y$  is a function of:

1. The specific heat ratio  $\gamma$ .
2. The ratio ( $\beta$ ) of orifice or throat diameter to inlet diameter.
3. Ratio of downstream to upstream absolute pressures.

This factor<sup>9,10</sup> has been experimentally determined on the basis of air, which has a specific heat ratio of 1.4, and steam having specific heat ratios of approximately 1.3. The data is plotted on page A-21.

Values of  $\gamma$  for some of the common vapors and gases are given on pages A-8 and A-9. The specific heat ratio  $\gamma$  may vary slightly for different pressures and temperatures but for most practical problems the values given will provide reasonably accurate results.

Equation 2-24 may be used for orifices discharging compressible fluids to atmosphere by using:

1. Flow coefficient  $C$  given on page A-20 in the Reynolds number range where  $C$  is a constant for the given diameter ratio,  $\beta$ .
2. Expansion factor  $Y$  per page A-21.
3. Differential pressure  $\Delta p$ , equal to the inlet gauge pressure.

This also applies to nozzles discharging compressible fluids to atmosphere only if the absolute inlet pressure is less than the absolute atmospheric pressure divided by the critical pressure ratio  $r_c$ ; this is discussed on the next page. When the absolute inlet pressure is greater than this amount, flow through nozzles should be calculated as outlined on the following page.

**Flow Through Nozzles and Orifices — continued**

**Maximum flow of compressible fluids in a nozzle:** A smoothly convergent nozzle has the property of being able to deliver a compressible fluid up to the velocity of sound in its minimum cross section or throat, providing the available pressure drop is sufficiently high. Sonic velocity is the maximum velocity that may be attained in the throat of a nozzle (supersonic velocity is attained in a gradually divergent section following the convergent nozzle, when sonic velocity exists in the throat).

The critical pressure ratio is the largest ratio of downstream pressure to upstream pressure capable of producing sonic velocity. Values of critical pressure ratio  $r_c$  which depend upon the ratio of nozzle diameter to upstream diameter as well as the specific heat ratio  $\gamma$  are given on page A-21

Flow through nozzles and venturi meters is limited by critical pressure ratio and minimum values of  $Y$  to be used in Equation 2-24 for this condition, are indicated on page A-21 by the termination of the curves at  $P'_2/P'_1 = r_c$ .

Equation 2-24 may be used for discharge of compressible fluids through a nozzle to atmosphere, or to a downstream pressure lower than indicated by the critical pressure ratio  $r_c$ , by using values of:

- $Y$  . . . . . minimum per page A-21
- $C$  . . . . . page A-20
- $\Delta P$  . . . . .  $P'_1(1 - r_c); r_c$  per page A-21
- $\rho$  . . . . . density at upstream condition

**Flow through short tubes:** Since complete experimental data for the discharge of fluids to atmosphere through short tubes ( $L/D$  is less than, or equal to, 2.5 pipe diameters)<sup>1</sup> are not available, it is suggested that reasonably accurate approximations may be obtained by using Equations 2-23 and 2-24, with values of  $C$  somewhere between those for orifices and nozzles, depending upon entrance conditions.

If the entrance is well rounded,  $C$  values would tend to approach those for nozzles, whereas short tubes with square entrance would have characteristics similar to those for square edged orifices.

**Discharge of Fluids Through Valves, Fittings, and Pipe**

**Liquid flow:** To determine the flow of liquid through pipe, the Darcy formula is used. Equation 1-4 (page 1-6) has been converted to more convenient terms in Chapter 3 and has been rewritten as Equation 3-14. Expressing this equation in terms of flow rate in litres per minute:

$$h_L = \frac{22.96 KQ^2}{d^4}$$

Solving for  $Q$ , the equation can be rewritten,

$$Q = 0.2087 d^2 \sqrt{\frac{h_L}{K}} \tag{Equation 2-25}$$

Equation 2-25 can be employed for valves, fittings, and pipe where  $K$  would be the sum of all the resistances in the piping system, including entrance and exit losses when they exist. Examples of problems of this type are shown on page 4-12.

**Compressible flow:** When a compressible fluid flows from a piping system into an area of larger cross section than that of the pipe, as in the case of discharge to atmosphere, a modified form of the Darcy formula, Equation 1-11 developed on page 1-9, is used.

$$w = 1.111 \times 10^{-6} Y d^2 \sqrt{\frac{\Delta P}{K \bar{V}_1}}$$

The determination of values of  $K$ ,  $Y$ , and  $\Delta P$  in this equation is described on page 1-9 and is illustrated in the examples on pages 4-13 and 4-14. This equation is also given in Chapter 3, page 3-5, Equation 3-22, in terms of pressure drop in bars ( $\Delta p$ ).

**Figure 2-17**  
Pressure measurements made at strategic points in a valve in order to establish optimum design.

**Figure 2-18**  
Flow test on plastic pipe to determine pressure drop due to 90 degree bends.

# Formulas and Nomographs For Flow Through Valves, Fittings, and Pipe

## CHAPTER 3

Only basic formulas needed for the presentation of the theory of fluid flow through valves, fittings, and pipe were presented in the first two chapters of this paper. In the summary of formulas given in this chapter, the basic formulas are rewritten in terms of the SI metric units which it is anticipated will be commonly used following the change-over to the metric system or, where this is already in being, the adoption of SI units.

In each case a choice of equations is given enabling the user to select the formula most suited to the available data.

Nomographs presented in this chapter are graphical solutions of the flow formulas applying to pipe. Valve and fitting flow problems may also be solved by means of these nomographs by determining their equivalent length in terms of metres of straight pipe.

Due to the wide variety of terms and the variation in the physical properties of liquids and gases, it was necessary to divide the nomographs into two parts: the first part (pages 3-6 to 3-15) pertains to liquid flow, and the second part (pages 3-16 to 3-27), pertains to compressible flow.

All nomographs for the solution of pressure drop problems are based upon Darcy's formula, since it is a general formula which is applicable to all fluids and can be applied to all types of pipe through the use of the Moody Friction Factor Diagram. Darcy's formula also provides a means of solving problems of flow through valves and fittings on the basis of equivalent length or resistance coefficient. Nomographs provide simple, rapid, practical, and reasonably accurate solutions to flow formulas and the decimal point is accurately located.

Accuracy of a nomograph is limited by the available page space, length of scales, number of units provided on each scale, and the angle at which the connecting line crosses the scale. Whenever the solution of a problem falls beyond the range of a nomograph, the solution of the formula must be obtained by calculation.

## Summary of Formulas

To eliminate needless duplication, formulas have been written in terms of either specific volume  $\bar{V}$  or density  $\rho$ , but not in terms of both, since one is the reciprocal of the other.

$$\bar{V} = \frac{1}{\rho} \quad \rho = \frac{1}{\bar{V}}$$

These equations may be substituted in any of the formulas shown in this paper whenever necessary.

- **Bernoulli's theorem:**

Equation 3-1

$$Z + \frac{P}{\rho g_n} + \frac{v^2}{2g_n} = H$$

$$Z_1 + \frac{P_1}{\rho_1 g_n} + \frac{v_1^2}{2g_n} = Z_2 + \frac{P_2}{\rho_2 g_n} + \frac{v_2^2}{2g_n} + h_L$$

- **Mean velocity of flow in pipe:**

(Continuity Equation)

Equation 3-2

$$v = \frac{q}{A} = 1273\,000 \frac{q}{d^2} = 21.22 \frac{Q}{d^2}$$

$$v = 56.23 \frac{B}{d^2} = 1273\,000 \frac{w\bar{V}}{d^2} = 354 \frac{W\bar{V}}{d^2}$$

$$v = 1.243 \frac{q'_h T}{\rho' d^2} = 433 \frac{q'_h S_g}{\rho d^2}$$

$$V = \frac{q_m}{A} = 16\,670 \frac{W\bar{V}}{a} = 21\,220 \frac{W\bar{V}}{d^2}$$

$$V = 74.55 \frac{q'_h T}{\rho' d^2} = 25\,970 \frac{q'_h S_g}{\rho d^2}$$

- **Reynolds number of flow in pipe:**

Equation 3-3

$$R_e = \frac{Dvp}{\mu'} = \frac{dvp}{1000\mu'} = \frac{dvp}{\mu}$$

$$R_e = 1273\,000 \frac{q\rho}{d\mu} = 318.3 \frac{q\rho}{R_H\mu} = 21.22 \frac{Q\rho}{d\mu}$$

$$R_e = 354 \frac{W}{d\mu} = 432 \frac{q'_h S_g}{d\mu} = 56.23 \frac{B\rho}{d\mu}$$

$$R_e = \frac{Dv}{\nu'} = \frac{dv}{1000\nu'} = 1000 \frac{dv}{\nu}$$

$$R_e = 1273 \times 10^6 \frac{q}{d\nu} = 21\,220 \frac{Q}{d\nu} = 354\,000 \frac{W\bar{V}}{d\nu}$$

- **Viscosity equivalents:**

Equation 3-4

$$\nu = \frac{\mu}{\rho'} = \frac{\mu}{S}$$

- **Head loss and pressure drop in straight pipe:**

Pressure loss due to flow is the same in a sloping, vertical, or horizontal pipe. However, the difference in pressure due to the difference in head must be considered in pressure drop calculations: see page 1-5.

Darcy's formula:

Equation 3-5

$$h_L = f \frac{L}{D} \frac{v^2}{2g_n} = 51 \frac{fLv^2}{d}$$

$$h_L = 8265 \times 10^{10} \frac{fLq^2}{d^5} = 22\,950 \frac{fLQ^2}{d^5}$$

$$h_L = 161\,200 \frac{fLB^2}{d^5} = 6\,376\,000 \frac{fLW^2\bar{V}^2}{d^5}$$

$$\Delta p = 0.005 \frac{fL\rho v^2}{d} = 0.000\,001\,39 \frac{fL\rho V^2}{d}$$

$$\Delta p = 81\,055 \times 10^5 \frac{fL\rho q^2}{d^5} = 2.252 \frac{fL\rho Q^2}{d^5}$$

$$\Delta p = 15.81 \frac{fL\rho B^2}{d^5} = 625.3 \frac{fLW^2\bar{V}}{d^5}$$

$$\Delta p = 2.69 \frac{fLT(q'_h)^2 S_g}{d^5 \rho'}$$

$$\Delta p = 936.5 \frac{fL(q'_h)^2 S_g^2}{d^5 \rho}$$

- **Head loss and pressure drop with laminar flow in straight pipe:**

For laminar flow conditions ( $R_e < 2000$ ), the friction factor is a direct mathematical function of the Reynolds number only, and can be expressed by the formula:  $f = 64/R_e$ . Substituting this value of  $f$  in the Darcy formula, it can be rewritten:

$$h_L = 3263 \frac{\mu Lv}{d^2 \rho}$$

Equation 3-6

$$h_L = 41\,550 \times 10^5 \frac{\mu Lq}{d^4 \rho} = 69\,220 \frac{\mu LQ}{d^4 \rho}$$

$$h_L = 183\,500 \frac{\mu LB}{d^4 \rho} = 1\,154\,000 \frac{\mu LW}{d^4 \rho^2}$$

$$\Delta p = 0.32 \frac{\mu Lv}{d^2} = 407\,400 \frac{\mu Lq}{d^4}$$

$$\Delta p = 6.79 \frac{\mu LQ}{d^4} = 18 \frac{\mu LB}{d^2}$$

$$\Delta p = 113.2 \frac{\mu LW}{d^4 \rho}$$

## Summary of Formulas — continued

- Limitations of Darcy formula

- Non-compressible flow; liquids:

The Darcy formula may be used without restriction for the flow of water, oil, and other liquids in pipe. However, when extreme velocities occurring in pipe cause the downstream pressure to fall to the vapour pressure of the liquid, cavitation occurs and calculated flow rates are inaccurate.

- Compressible flow; gases and vapours:

When pressure drop is less than 10% of  $p_1$ , use  $\rho$  or  $\bar{V}$  based on either inlet or outlet conditions.

When pressure drop is greater than 10% of  $p_1$ , but less than 40% of  $p_1$ , use the average of  $\rho$  or  $\bar{V}$  based on inlet and outlet conditions, or use Equation 3-20.

When pressure drop is greater than 40% of  $p_1$ , use the rational or empirical formulas given on this page for compressible flow, or use Equation 3-20 (for theory, see page 1-9).

- Isothermal flow of gas in pipe lines

$$w = 316.23 \sqrt{\frac{A^2}{\bar{V}_1 \left( f \frac{L}{D} + 2 \log_e \frac{p_1}{p_2} \right)} \left( \frac{(p_1')^2 - (p_2')^2}{p_1'} \right)} \quad \text{Equation 3-7}$$

$$w = 0.0002484 \sqrt{\frac{d^4}{\bar{V}_1 \left( f \frac{L}{D} + 2 \log_e \frac{p_1}{p_2} \right)} \left( \frac{(p_1')^2 - (p_2')^2}{p_1'} \right)}$$

- Simplified compressible flow for long pipe lines

$$w = 316.23 \sqrt{\left( \frac{A^2}{\bar{V}_1 f \frac{L}{D}} \right) \left[ \frac{(p_1')^2 - (p_2')^2}{p_1'} \right]} \quad \text{Equation 3-7a}$$

$$w = 0.000007855 \sqrt{\left( \frac{d^5}{\bar{V}_1 f L} \right) \left[ \frac{(p_1')^2 - (p_2')^2}{p_1'} \right]}$$

$$q'_h = 0.01361 \sqrt{\left( \frac{(p_1')^2 - (p_2')^2}{f L_m T S_g} \right) d^5}$$

- Maximum (sonic) velocity of compressible fluids in pipe

The maximum possible velocity of a compressible fluid in a pipe is equivalent to the speed of sound in the fluid; this is expressed as:

$$v_s = \sqrt{\gamma R T} \quad \text{Equation 3-8}$$

$$v_s = \sqrt{\gamma P' \bar{V}} = 316.2 \sqrt{\gamma p' \bar{V}}$$

- Empirical formulas for the flow of water, steam, and gas

Although the rational method (using Darcy's formula) for solving flow problems has been recommended in this paper, some engineers prefer to use empirical formulas.

- Hazen and Williams formula for flow of water:

Equation 3-9

$$Q = 0.000599 d^{2.63} c \left( \frac{p_1 - p_2}{L} \right)^{0.54}$$

where:

$c = 140$  for new steel pipe

$c = 130$  for new cast iron pipe

$c = 110$  for riveted pipe

Equation 3-10 (deleted)

- Spitzglass formula for low pressure gas: (pressure less than 7000 N/m<sup>2</sup> (7 kPa))

Equation 3-11

$$q'_h = 0.00338 \sqrt{\frac{\Delta h_w d^5}{S_g L \left( 1 + \frac{91.5}{d} + 0.00118 d \right)}}$$

Flowing temperature is 15°C

- Weymouth formula for high pressure gas:

Equation 3-12

$$q'_h = 0.00261 d^{2.667} \sqrt{\left( \frac{(p_1')^2 - (p_2')^2}{S_g L_m} \right) \left( \frac{288}{T} \right)}$$

- Panhandle formula<sup>3</sup> for natural gas pipe lines 150 to 600 mm diameter and  $R_e = (5 \times 10^6)$  to  $(14 \times 10^6)$ :

Equation 3-13

$$q'_h = 0.00506 E d^{2.6182} \left( \frac{(p_1')^2 - (p_2')^2}{L_m} \right)^{0.5394}$$

where: gas temperature = 15°C

$S_g = 0.6$

$E =$  flow efficiency

$E = 1.00$  (100%) for brand new pipe without any bends, elbows, valves, and change of pipe diameter or elevation

$E = 0.95$  for very good operating conditions

$E = 0.92$  for average operating conditions

$E = 0.85$  for unusually unfavourable operating conditions

## Summary of Formulas — continued

- **Head loss and pressure drop through valves and fittings**

Head loss through valves and fittings is generally given in terms of resistance coefficient  $K$  which indicates static head loss through a valve in terms of "velocity head", or, equivalent length in pipe diameters  $L/D$  that will cause the same head loss as the valve.

From Darcy's formula, head loss through a pipe is:

$$h_L = f \frac{L}{D} \frac{v^2}{2g_n} \quad \text{Equation 3-5}$$

and head loss through a valve is:

$$h_L = K \frac{v^2}{2g_n} \quad \text{Equation 3-14}$$

therefore:  $K = f \frac{L}{D}$  Equation 3-15

To eliminate needless duplication of formulas, the following are all given in terms of  $K$ . Whenever necessary, substitute  $(fL/D)$  for  $(K)$ .

$$h_L = 8265 \times 10^7 \frac{Kq^2}{d^5} = 22.96 \frac{KQ^2}{d^5} \quad \text{Equation 3-14}$$

$$h_L = 161.2 \frac{KB^2}{d^5} = 6377 \frac{KW^2 \bar{V}^2}{d^5}$$

$$\Delta p = 0.000\ 005\ K\rho v^2 = 0.000\ 1389 \times 10^{-5} K\rho V^2$$

$$\Delta p = 8105\ 500 \frac{K\rho q^2}{d^5} = 0.002\ 25 \frac{K\rho Q^2}{d^5}$$

$$\Delta p = 0.0158 \frac{K\rho B^2}{d^5}$$

$$\Delta p = 0.6253 \frac{KW^2 \bar{V}}{d^5}$$

$$\Delta p = 0.002\ 69 \frac{K(q'_h)^2 T S_g}{d^5 p}$$

$$\Delta p = 0.9365 \frac{K(q'_h)^2 S_g^2}{d^5 \rho}$$

For compressible flow with  $h_L$  or  $\Delta p$  greater than approximately 10% of inlet absolute pressure, the denominator should be multiplied by  $Y^2$ . For values of  $Y$ , see page A-22.

- **Flow coefficient**

As explained on page 2-10 there is not yet an agreed definition for a flow coefficient in terms of SI units. The equations given below relate to  $C_v$  as expressed in Imperial units with flow rate in UK or US gallons per minute.

Flow rate  $Q$  in UK gal/min: Equation 3-16

$$C_v = Q \sqrt{\frac{\rho}{\Delta P (62.4)}} = \frac{24.9 d^2}{\sqrt{fL/D}} = \frac{24.9 d^2}{\sqrt{K}}$$

Flow rate  $Q$  in US gal/min:

$$C_v = Q \sqrt{\frac{\rho}{\Delta P (62.4)}} = \frac{29.9 d^2}{\sqrt{fL/D}} = \frac{29.9 d^2}{\sqrt{K}}$$

where  $\rho$  = density of liquid in lb/ft<sup>3</sup>  
 $\Delta P$  = pressure drop, in lbf/in<sup>2</sup>  
 $d$  = internal diameter, in inches  
 $L/D$  = equivalent length of valve in pipe diameters  
 $f$  = friction factor  
 $K$  = resistance coefficient

- **Resistance coefficient,  $K$ , for sudden and gradual enlargements in pipes**

For  $\theta \leq 45^\circ$ ,

$$K_1 = 2.6 \sin \frac{\theta}{2} (1 - \beta^2)^2 \quad \text{*Equation 3-17}$$

For  $45^\circ < \theta \leq 180^\circ$ ,

$$K_1 = (1 - \beta^2)^2 \quad \text{*Equation 3-17.1}$$

- **Resistance coefficient,  $K$ , for sudden and gradual contractions in pipes**

For  $\theta \leq 45^\circ$ ,

$$K_1 = 0.8 \sin \frac{\theta}{2} (1 - \beta^2) \quad \text{*Equation 3-18}$$

For  $45^\circ < \theta \leq 180^\circ$ ,

$$K_1 = 0.5 \sqrt{\sin \frac{\theta}{2} (1 - \beta^2)} \quad \text{*Equation 3-18.1}$$

**\*Note:** The values of the resistance coefficients ( $K$ ) in equations 3-17, 3-17.1, 3-18, and 3-18.1 are based on the velocity in the small pipe. To determine  $K$  values in terms of the greater diameter, divide the equations by  $\beta^4$ .

- **Discharge of fluid through valves, fittings, and pipe; Darcy's formula**

Liquid flow: Equation 3-19

$$q = 0.000\ 003\ 478\ d^2 \sqrt{\frac{h_L}{K}} = 0.000\ 3512\ d^2 \sqrt{\frac{\Delta p}{K\rho}}$$

$$Q = 0.2087\ d^2 \sqrt{\frac{h_L}{K}} = 21.07\ d^2 \sqrt{\frac{\Delta p}{K\rho}}$$

$$w = 0.000\ 003\ 478\ \rho d^2 \sqrt{\frac{h_L}{K}} = 0.000\ 3512\ d^2 \sqrt{\frac{\Delta p \rho}{K}}$$

$$W = 0.012\ 52\ \rho d^2 \sqrt{\frac{h_L}{K}} = 1.265\ d^2 \sqrt{\frac{\Delta p \rho}{K}}$$

Compressible flow:

$$q'_h = 19.31\ Y d^2 \sqrt{\frac{\Delta p p'_1}{K T_1 S_g}} \quad \text{Equation 3-20}$$

$$q'_h = 1.0312 \frac{Y d^2}{S_g} \sqrt{\frac{\Delta p p'_1}{K}}$$

$$q'_m = 0.3217\ Y d^2 \sqrt{\frac{\Delta p p'_1}{K T_1 S_g}} = 0.01719 \frac{Y d^2}{S_g} \sqrt{\frac{\Delta p p'_1}{K}}$$

$$q' = 0.005\ 363\ Y d^2 \sqrt{\frac{\Delta p p'_1}{K T_1 S_g}} = 0.000\ 2864 \frac{Y d^2}{S_g} \sqrt{\frac{\Delta p p'_1}{K}}$$

$$w = 0.000\ 3512\ Y d^2 \sqrt{\frac{\Delta p p'_1}{K V_1}} \quad W = 1.265\ Y d^2 \sqrt{\frac{\Delta p p'_1}{K V_1}}$$

Values of  $Y$  are shown on page A-22. For  $K$ ,  $Y$ , and  $\Delta p$  determination, see examples on pages 4-13 and 4-14.

## Summary of Formulas — concluded

## • Flow through nozzles and orifices

( $h_L$  and  $\Delta p$  measured across taps at 1 diameter and 0.5 diameter)

Liquid:

$$q = Av = AC \sqrt{2g_n h_L} = AC \sqrt{\frac{2 \Delta p}{\rho}} \quad \text{Equation 3-21}$$

$$q = 0.000\,003\,48\, d_1^2 C \sqrt{h_L} = 0.000\,3512\, d_1^2 C \sqrt{\frac{\Delta p}{\rho}}$$

$$Q = 0.2087\, d_1^2 C \sqrt{h_L} = 21.07\, d_1^2 C \sqrt{\frac{\Delta p}{\rho}}$$

$$w = 0.000\,003\,48\, d_1^2 C \sqrt{h_L \rho^2} = 0.000\,3512\, d_1^2 C \sqrt{\Delta p \rho}$$

$$W = 0.012\,52\, d_1^2 C \sqrt{h_L \rho^2} = 1.265\, d_1^2 C \sqrt{\Delta p \rho}$$

Values of  $C$  are shown on page A-20  
 $d_1$  = nozzle or orifice diameter

Compressible fluids:

Equation 3-22

$$q'_h = 19.31\, Y\, d_1^2 C \sqrt{\frac{\Delta p p'_1}{T_1 S_g}}$$

$$q'_h = 1.0312 \frac{Y\, d_1^2 C}{S_g} \sqrt{\Delta p p_1}$$

$$q'_m = 0.3217\, Y\, d_1^2 C \sqrt{\frac{\Delta p p'_1}{T_1 S_g}}$$

$$q'_m = 0.01719 \frac{Y\, d_1^2 C}{S_g} \sqrt{\Delta p p_1}$$

$$q = 0.005\,363\, Y\, d_1^2 C \sqrt{\frac{\Delta p p'_1}{T_1 S_g}}$$

$$q' = 0.000\,2864 \frac{Y\, d_1^2 C}{S_g} \sqrt{\Delta p p_1}$$

$$w = 0.000\,3512\, Y\, d_1^2 C \sqrt{\frac{\Delta p}{V_1}}$$

$$W = 1.265\, Y\, d_1^2 C \sqrt{\frac{\Delta p}{V_1}}$$

Values of  $C$  are shown on page A-20  
Values of  $Y$  are shown on page A-21  
 $d_1$  = nozzle or orifice diameter

## • Equivalent of head loss and pressure drop

Equation 3-23

$$h_L = \frac{10200 \Delta p}{\rho} \quad \Delta p = \frac{h_L \rho}{10200}$$

• Changes in resistance coefficient  $K$  required to compensate for different pipe inside diameter

$$K_a = K_b \left( \frac{d_a}{d_b} \right)^5$$

Equation 3-24  
(see page A-30)

Subscript  $a$  refers to pipe in which valve will be installed.  
Subscript  $b$  refers to pipe for which the resistance coefficient  $K$  was established.

## • Specific gravity of liquids

Any liquid:

Equation 3-25

$$s = \frac{\rho}{\rho_{\text{water at 60 F (15.6 C)}}} \quad \begin{matrix} \text{(any liquid at 60 F (15.6 C))} \\ \text{unless otherwise specified} \end{matrix}$$

Oils:

Equation 3-26

$$S (60\text{ F}/60\text{ F}) = \frac{141.5}{131.5 + \text{Deg API}}$$

Liquids lighter than water:

Equation 3-27

$$S (60\text{ F}/60\text{ F}) = \frac{140}{130 + \text{Deg Baumé}}$$

Liquids heavier than water:

Equation 3-28

$$S (60\text{ F}/60\text{ F}) = \frac{145}{145 - \text{Deg Baumé}}$$

## • Specific gravity of gases

Equation 3-29

$$S_g = \frac{R (\text{air})}{R (\text{gas})} = \frac{287}{R (\text{gas})}$$

$$S_g = \frac{M (\text{gas})}{M (\text{air})} = \frac{M (\text{gas})}{29}$$

## • General gas laws for perfect gases

$$P'V_a = w_a RT$$

Equation 3-30

$$\rho = \frac{w_a}{V_a} = \frac{P'}{RT} = \frac{10^5 p'}{RT}$$

Equation 3-31

$$R = \frac{8314}{M} = \frac{P'}{\rho T}$$

Equation 3-32

$$P'V_a = n_a MRT = n_a 8314T = \frac{w_a}{M} 8314T$$

Equation 3-33

$$\rho = \frac{w_a}{V_a} = \frac{P'M}{8314T} = \frac{P'S_g}{287T} = \frac{348.4 p'S_g}{T}$$

Equation 3-34

where:

$$n_a = w_a/M = \text{number of mols of a gas}$$

## • Hydraulic radius\*

Equation 3-35

$$R_H = \frac{\text{cross sectional flow area (square metres)}}{\text{wetted perimeter (metres)}}$$

Equivalent diameter relationship:

$$D = 4R_H$$

$$d = 4000R_H$$

\* See page 1-4 for limitations

**Velocity of Liquids in Pipe**

The mean velocity of any flowing liquid can be calculated from the following formula, or, from the nomograph on the opposite page. The nomograph is a graphical solution of the formula.

$$v = 1273.2 \times 10^3 \frac{q}{d^2} = 21.22 \frac{Q}{d^2} = 353.7 \frac{W}{d^2 \rho}$$

The pressure drop per 100 metres and the velocity in Schedule 40 pipe, for water at 15°C, have been calculated for commonly used flow rates for pipe sizes of 1/8 to 24 inch; these values are tabulated on page B-13.

**Example 1**

*Given:* No 3 Fuel Oil at 15°C flows through a 2 inch Schedule 40 pipe at the rate of 20,000 kilograms per hour.

*Find:* The rate of flow in litres per minute and the mean velocity in the pipe.

*Solution:*

1.  $\rho = 897$  .....page A-7

	Connect		Read
2.	$W = 20,000$	$\rho = 897$	$Q = 375$
3.	$Q = 375$	2" Sched 40	$v = 2.9$

**Example 2**

*Given:* Maximum flow rate of a liquid will be 1400 litres per minute with maximum velocity limited to 3 metres per second.

*Find:* The smallest suitable size of steel pipe to ISO 336.

*Solution:*

Connect		Read
$Q = 1400$	$v = 3$	$d = 100$

- 1.
2. From the table on page B-19 the smallest suitable size of steel pipe to ISO 336 is seen to be nominal size 4", inside diameter 100.1 mm.

**Reasonable Velocities**

for the Flow of water through Pipe

Service Condition	Reasonable Velocity
Boiler Feed . . . . .	.2.4 to 4.6 metres per second
Pump Suction and Drain Lines . . . . .	.1.2 to 2.1 metres per second
General Service . . . . .	.1.2 to 3.0 metres per second
City . . . . .	to 2.1 metres per second

Velocity of Liquids in Pipe

(continued)

Reynolds Number for Liquid Flow  
Friction Factor for Clean Steel Pipe

Reynolds number may be calculated from the formula below, or, from the nomograph on the opposite page. The nomograph is a graphical solution of the formula.

$$R_e = 1273 \times 10^3 \frac{Q\rho}{d\mu} = 21.22 \frac{Q\rho}{d\mu} = 354 \frac{W}{d\mu}$$

(For values of  $d$  see pages B-16 to B-21)

The friction factor for clean steel pipe can be obtained from the chart in the centre of the nomograph. Friction factors for other types of pipe can be determined by using the Reynolds number obtained from the nomograph or by calculation and referring to pages A-23 and A-24.

**Example 1**

*Given:* Water at 90°C flows through a 4-inch Schedule 40 steel pipe at a rate of 1590 litres per minute.

*Find:* The flow rate in kilograms per hour, the Reynolds number and the friction factor.

*Solution:*

1.  $\rho = 965$  ..... page A-6
2.  $\mu = 0.31$  ..... page A-3
3.  $d = 102.3$  ..... page B-16

Connect		Read

$f = 0.017$	$\rho = 965$	Index 1
Index 1	$Q = 1590$	Index 2
Index 2	4" Sched 40	$\Delta p_{100} = 0.85$

**Example 2**

*Given:* Oil of density 897 kg/m<sup>3</sup> flows through a 51 mm inside diameter pipe at a velocity of 3 metres per second.

*Find:* The pressure drop per 100 metres of pipe.

*Solution:*

1.  $\rho = 897$
2.  $q = .006$ ..... nomograph, page 3-7
3.  $f = 0.03$ ..... Example 2, page 3-8

Connect		Read
$\rho = 897$	$f = 0.03$	Index 1
Index 1	$q = 0.006$	Index 2
Index 2	$d = 51$	$\Delta p_{100} = 2.4$

The pressure drop of flowing liquids can be calculated from the Darcy formula that follows, or, from the nomograph on the opposite page. The nomograph is a graphical solution of the formula.

$$\Delta p_{100} = 0.5 \frac{f \rho v^2}{d} = 81\,055 \times 10^{-7} \frac{f \rho q^2}{d^5}$$

$$\Delta p_{100} = 225 \frac{f \rho Q^2}{d^5} = 62\,530 \frac{f W^2}{d^5 \rho}$$

(For values of  $d$  see pages B-16 to B-21)

When flow rate is given in kilograms per hour ( $W$ ), use the following equations to convert to litres per minute ( $Q$ ) or cubic metres per second ( $q$ ), or use the nomograph on the preceding page.

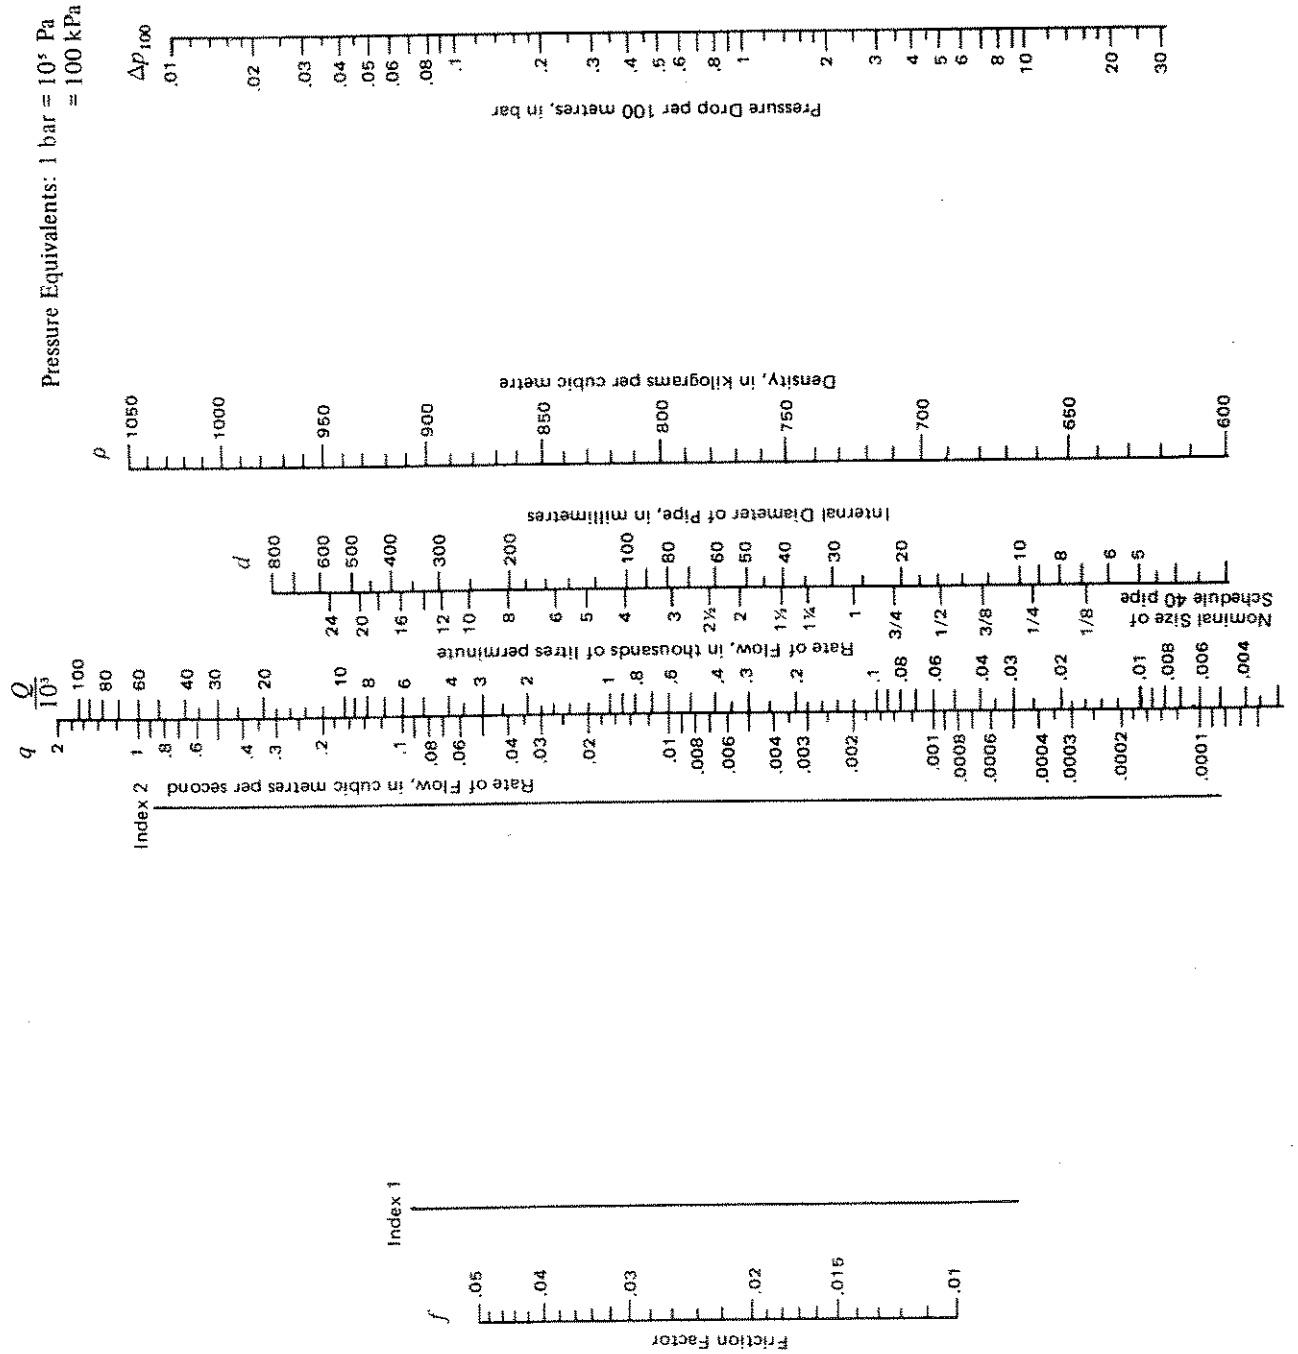

$$Q = \frac{W}{0.06 \rho} \quad ; \quad q = \frac{W}{3600 \rho}$$

For Reynolds number less than 2000, flow is considered laminar and the nomograph on page 3-13 should be used.

The pressure drop per 100 metres and the velocity in Schedule 40 pipe, for water at 15°C, have been calculated for commonly used flow rates for pipe sizes of 1/8 to 24 inch; these values are tabulated on page B-13.

Pressure Drop in Liquid Lines for Turbulent Flow

(continued)

Pressure Drop in Liquid Lines for Laminar Flow

Pressure drop can be calculated from the formula below, or, from the nomograph on the opposite page, only when the flow is laminar. The nomograph is a graphical solution of the formula.

Flow is considered to be laminar at Reynolds number of 2000 or less; therefore, before using the formula or nomograph, determine the Reynolds number from the formula on page 3-2 or the nomograph on page 3-9.

$$\Delta p_{100} = 32 \frac{\mu v}{d^2} = 4074 \times 10^4 \frac{\mu q}{d^3}$$

$$\Delta p_{100} = 679 \frac{\mu Q}{d^3}$$

Where  $\Delta p_{100}$  is the pressure drop in bar for 100 metres of pipe.

(For values of  $d$  see pages B-16 to B-21)

Example 1

Given: A lubricating oil of density 897 kg/m<sup>3</sup> and viscosity 450 centipoise flows through a 6 inch Schedule 40 steel pipe at a rate of 3000 litres per minute.

Find: The pressure drop per 100 metres of pipe.

Solution:

1.  $\rho = 897$
2.  $\mu = 450$
3.  $R_e = 825$  . . . . . page 3-9
4. Since  $R_e < 2000$ , the flow is laminar and the nomograph on the opposite page may be used.

	Connect		Read
5.	$\mu = 450$	$Q = 3000$	Index
6.	Index	6" Sched 40	$\Delta p_{100} = 1.63$

Example 2

Given: Oil having a density of 875 kg/m<sup>3</sup> and viscosity 95 centipoise flows through a steel pipe 79 mm inside diameter at a velocity of 2 metres per second.

Find: The flow rate in litres per minute and the pressure drop in 40 metres of pipe.

Solution:

1.  $\rho = 875$
2.  $\mu = 95$
3.  $Q = 590$  . . . . . page 3-7
4.  $R_e = 1450$  . . . . . page 3-9
5. Since  $R_e < 2000$ , the flow is laminar and the nomograph on the opposite page may be used.

	Connect		Read
6.	$\mu = 95$	$Q = 590$	Index
7.	Index	$d = 79$	$\Delta p_{100} = 1$

8. For 40 metres of pipe the pressure drop

$$\Delta p_{40} = \frac{40}{100} \times 1 = 0.4$$

Pressure Drop in Liquid Lines for Laminar Flow

(continued)

Flow of Liquids Through Nozzles and Orifices

The flow of liquids through nozzles and orifices can be determined from the following formula, or, from the nomograph on the opposite page. The nomograph is a graphical solution of the formula.

$$q = 3.48 \times 10^{-6} d_1^2 C \sqrt{h_L} = 3.51 \times 10^{-4} d_1^2 C \sqrt{\frac{\Delta p}{\rho}}$$

$$Q = 0.209 d_1^2 C \sqrt{h_L} = 21.07 d_1^2 C \sqrt{\frac{\Delta p}{\rho}}$$

$d_1$  = nozzle or orifice diameter

Head loss or pressure drop is measured across taps located 1 diameter upstream and 0.5 diameter downstream.

**Example 1**

*Given:* A differential pressure of 0.2 bar is measured across taps of a 50 mm inside diameter nozzle assembled in 3-inch Schedule 80 steel pipe carrying water at 15°C.

*Find:* The flow rate in litres per minute

*Solution:*

1.  $d_2$  (inlet diam) 73.7 . . . . . 3" Sched 80 pipe; page B-16
2.  $\beta = \frac{d_1}{d_2} = (50 \div 73.7) = 0.68$
3.  $C = 1.12$  . turbulent flow assumed; page A-20
4.  $\rho = 999$  . . . . . page A-6

Index	$d_1 = 50$	$Q = 830$

5. Calculate  $R_e$  based on I.D. of pipe (73.66 mm)
9.  $\mu = 1.1$  . . . . . page A-3
10.  $R_e = 220\ 000$  . . . . . page 3-9
11.  $C = 1.12$  correct for  $R_e = 220\ 000$ ; page A-20
12. When the  $C$  factor assumed in Step 3 is not in agreement with page A-20 for the Reynolds number based on the calculated flow the factor must be adjusted until reasonable agreement is reached by repeating Steps 3 to 11 inclusive.

**Example 2**

*Given:* The flow of water, at 15°C through a 6-inch pipe, 150.7 mm I.D., is to be restricted to 850 litres per minute by means of a square edged orifice, across which there will be a differential head of 1.2 metres of water.

*Find:* The size of the orifice opening.

**Example 2 — cont.**

*Solution:*

1.  $\rho = 999$  . . . . . page A-6
2.  $u = 1.1$  . . . . . page A-3
3.  $R_e = 110\ 000$  . . . . . page 3-9
4. Assume a  $\beta$  ratio of say 0.50
5.  $d_2$  (inlet diam) = 150.7
6.  $d_1 = 0.50 d_2 = 0.50 \times 150.7 = 75.35$
7.  $C = 0.62$  . . . . . page A-20

Connect		Read

Pressure Drop in Compressible Flow Lines

The pressure drop of flowing compressible fluids can be calculated from the Darcy formula below, or, from the nomograph on the opposite page. The nomograph is a graphical solution of the formula.

$$\Delta p_{100} = 62\,530 \frac{f W^2 \bar{V}}{d^5} = 62\,530 \frac{f W^2}{d^5 \rho}$$

$$\Delta p_{100} = 93\,650 \frac{f (q'_h)^2 S_g^2}{d^5 \rho}$$

(For values of  $d$ , see pages B-16 to B-21)

When the flow rate is given in cubic metres per hour at standard conditions ( $q'_h$ ), use the following equation or the nomograph on page B-2 to convert to kilograms per hour ( $W$ ).

$$W = 1.225 q'_h S_g$$

**Air:** For pressure drop in bar per 100 metres of Schedule 40 pipe for air at 7 bar gauge and 15°C, see page B-14.

**Example 1**

**Given:** Steam at 40 bar gauge and 450°C flows through a 4-inch Schedule 80 pipe at a rate of 14 000 kilograms per hour.

**Find:** The pressure drop per 100 metres of pipe.

**Solution:**

1.  $d = 97.2$  ..... page B-16
2.  $\mu = 0.029$  ..... page A-2
3.  $f = 0.017$  ..... page 3-19
4.  $\bar{V} = 0.078$  ..... page 3-17 or A-15

Connect		Read
$W = 14\,000$	$d = 97.2$	Index 2
Index 2	$f = 0.017$	Index 1
Index 1	$\bar{V} = 0.078$	$\Delta p_{100} = 1.88$

**Example 2**

**Given:** Natural Gas at 17 bar gauge and 15°C flows through a steel pipe 200 mm inside diameter at a rate of 34 000 standard cubic metres per hour; its specific gravity is 0.62.

**Find:** The flow rate in kilograms per hour and the pressure drop per 100 metres of pipe.

**Solution:**

1.  $W = 26\,000$  ..... page B-2
2.  $\mu = 0.12$  ..... page A-5
3.  $f = 0.014$  ..... page 3-19

Pressure Drop in Compressible Flow Lines

(continued)

Pressure Equivalent: 1 bar =  $10^5$  Pa  
= 100 kPa

**Simplified Flow Formula for Compressible Fluids**

**Pressure Drop, Rate of Flow, and Pipe Size**

The simplified flow formula for compressible fluids is accurate for fully turbulent flow; in addition, its use provides a good approximation in calculations involving compressible fluid flow through commercial steel pipe for most normal flow conditions.

If velocities are low, friction factors assumed in the simplified formula may be too low; in such cases, the formula and nomograph shown on pages 3-20 and 3-21 may be used to provide greater accuracy.

The Darcy formula can be written in the following form;

$$\Delta p_{100} = \frac{62\,530 f W^2 \bar{V}}{d^5} = \left(\frac{W^2}{10^8}\right) \left(\frac{62\,530 \times 10^8 f}{d^5}\right) \bar{V}$$

Let  $C_1 = \frac{W^2}{10^8}$  and  $C_2 = \frac{62\,530 \times 10^8 f}{d^5}$

The simplified flow formula can then be written:

$$\Delta p_{100} = C_1 C_2 \bar{V} = \frac{C_1 C_2}{\rho}$$

$$C_1 = \frac{\Delta p_{100}}{C_2 \bar{V}} = \frac{\Delta p_{100} \rho}{C_2} \quad C_2 = \frac{\Delta p_{100}}{C_1 \bar{V}} = \frac{\Delta p_{100} \rho}{C_1}$$

$C_1$  = discharge factor, from chart at right

$C_2$  = size factor from tables on pages 3-23 to 3-25

The limitations of the Darcy formula for compressible flow, as outlined on page 3-3 apply also to the simplified flow formula.

**Example 1**

*Given:* Steam at 24 bar absolute and 250°C flows through an 8-inch Schedule 40 pipe at a rate of 100 000 kilograms per hour.

*Find:* The pressure drop per 100 metres of pipe.

*Solution:*  $C_1 = 100$   
 $C_2 = 0.257$  . . . . . facing page  
 $\bar{V} = 0.091 \text{ m}^3/\text{kg}$  . . . . . page 3-17 or A-15  
 $\Delta p_{100} = 100 \times 0.257 \times 0.091 = 2.34 \text{ bar}$

**Example 2**

*Given:* Pressure drop is 1 bar with 7 bar gauge air at 30°C flowing through 100 metres of 4 inch nominal size ISO steel pipe, 6.3 mm wall thickness.

*Find:* The flow rate in cubic metres per minute at metric standard conditions (1.013 25 bar and 15°C).

*Solution:*  $\Delta p_{100} = 1$   
 $C_2 = 9.42$  . . . . . page 3-24  
 $\rho = 9.21$  . . . . . page A-10  
 $C_1 = \frac{1 \times 9.21}{9.42} = 0.978$   
 $W = 9\,900$   
 $q'_m = W \div (73.5 S_g)$  . . . . . page B-2  
 $q'_m = 9\,900 \div (73.5 \times 1) = 134.7 \text{ m}^3/\text{min}$

Values of  $C_1$  (metric)

For  $C_2$  values see opposite page and pages 3-24, 3-25.  
 For example on determining pipe size see opposite page.

Example 3

Given: A 6 bar gauge saturated steam line with 9000 kilograms per hour flow is permitted a maximum pressure drop of 2.4 bar per 100 metres of pipe.

Find: The smallest size of ISO 336 steel pipe suitable.

Solution:  $\Delta p_{100} = 2.4$   $\bar{V} = 0.273$  ..... page 3-17 or A-12  
 $C_1 = 0.81$   $C_2 = \frac{2.4}{0.81 \times 0.273} = 10.85$

Reference to the table of C<sub>2</sub> values for ISO 336 pipes on page 3-24 shows that a 4 inch nominal size pipe with 7.1 mm wall thickness has the C<sub>2</sub> value nearest to, but less than, 10.85

The actual pressure drop per 100 metres of 4 inch, 7.1 mm wall thickness, pipe is;

$\Delta p_{100} = C_1 C_2 \bar{V} = 0.81 \times 10.22 \times 0.273 = 2.26$  bar

Notes.

- (1) The values of  $C_2$  for ISO steel pipes given above and on page 3-24 have been determined by interpolation based on the values of  $C_2$  established for ANSI Schedule pipes shown on page 3 - 23.
- (2) The sizes of ISO pipes included in the above table and the table on page 3-24 also cover most of the pipe sizes contained in BS 3600: 1973, within the same ranges of wall thicknesses.

Flow of Compressible Fluids Through Nozzles and Orifices

The flow of compressible fluids through nozzles and orifices can be determined from the following formula, or, by using the nomograph on the next page. The nomograph is a graphical solution of the formula.

$$w = 3.512 \times 10^{-4} Y d_1^2 C \sqrt{\Delta p \rho_1} = 3.512 \times 10^{-4} Y d_1^2 C \sqrt{\frac{\Delta p}{V_1}}$$

$$W = 1.265 Y d_1^2 C \sqrt{\Delta p \rho_1} = 1.265 Y d_1^2 C \sqrt{\frac{\Delta p}{V_1}}$$

$d_1$  = nozzle or orifice diameter.

(Pressure drop is measured across taps located 1 diameter upstream and 0.5 diameter downstream from the inlet face of the nozzle or orifice).

Example 1

*Given:* A differential pressure of 0.8 bar is measured across taps located 1 diameter upstream and 0.5 diameter downstream from the inlet face of a 25 mm inside diameter nozzle assembled in a 2-inch Schedule 40 steel pipe, in which, dry carbon dioxide (CO<sub>2</sub>) gas is flowing at 7 bar gauge pressure and 90°C.

*Find:* The flow rate in cubic metres per hour at metric standard conditions (MSC = 1.013 25 bar and 15°C).

*Solution:*

1.  $R = 189$
2.  $S_g = 1.529$
3.  $\gamma = 1.3$

Steps 3 through 7 are used to determine the Y factor.

4.  $p'_1 = p + 1.013 = 7 + 1.013 = 8.013$
5.  $\Delta p/p'_1 = 0.8 \div 8.013 = 0.0998$
6.  $d_2$  (inlet diam) = 52.5 . . 2" Sched 40 pipe; page B-16
7.  $\beta = d_1/d_2 = 25 \div 52.5 = 0.476$
8.  $Y = 0.93$  . . . . . page A-21
9.  $C = 1.02$  . turbulent flow assumed; page A-20
10.  $T = 273 + t = 273 + 90 = 363$
11.  $\rho_1 = 11.76$  . . . . . page A-10

Connect		Read
$\Delta p = 0.8$	$\rho_1 = 11.76$	Index 1
Index 1	$C = 1.02$	Index 2
Index 2	$d_1 = 25$	Index 3
Index 3	$Y = 0.93$	$W = 2300$

16.  $q_h^1 = 1220 \text{ m}^3/\text{h}$  at MSC . . . . . page B-2
17.  $\mu = 0.018$  . . . . . page A-5
18.  $R_e = 860\,000$  or  $8.6 \times 10^5$  . . . . . page 3-2
19.  $C = 1.02$  is correct for  $R_e = 8.6 \times 10^5$  . . . . . page A-20
20. When the C factor assumed in Step 9 is not in agreement with page A-20, for the Reynolds number based on the calculated flow, it must be adjusted until reasonable agreement is reached by repeating Steps 9 through 19.

Example 2

*Given:* A differential pressure of 0.2 bar is measured across taps located 1 diameter up-stream and 0.5 diameter downstream from the inlet face of an 18 mm inside diameter square edged orifice assembled in a 25.7 mm inside diameter steel pipe, in which, dry ammonia (NH<sub>3</sub>) gas is flowing at 2.75 bar gauge pressure and 10°C.

*Find:* The flow rate in kilograms per second and in cubic metres per minute at metric standard conditions (1.013 25 bar and 15°C).

*Solution:*

1.  $R = 490$
  2.  $S_g = 0.596$
  3.  $\gamma = 1.32$
- Steps 3 through 7 are used to determine the Y factor.
4.  $p'_1 = p + 1.013 = 2.75 + 1.013 = 3.763$
  5.  $\Delta p/p'_1 = 0.2 \div 3.763 = 0.0531$
  6.  $\beta = d_1/d_2 = 18 \div 25.7 = 0.700$   
( $d_1$  = orifice diameter,  $d_2$  = inlet diameter)
  7.  $Y = 0.98$  . . . . . page A-21
  8.  $C = 0.70$  turbulent flow assumed; . . page A-20
  9.  $T = 273 + t = 273 + 10 = 283$
  10.  $\rho_1 = 2.76$  . . . . . page A-10 or 3-5

Connect		Read
$\Delta p = 0.2$	$\rho_1 = 2.76$	Index 1
Index 1	$C = 0.70$	Index 2
Index 2	$d_1 = 18$	Index 3
Index 3	$Y = 0.98$	$w = 0.058$
Index 3	$Y = 0.98$	$W = 205$

16.  $q'_m = \frac{W}{73.5 S_g} = \frac{205}{73.5 \times 0.596} = 4.68$  . . . . . page B-2
17.  $\mu = 0.010$  . . . . . page A-5
18.  $R_e = 282\,000$  or  $2.82 \times 10^5$  . . . . . page 3-2
19.  $C = 0.70$  is correct for  $R_e = 2.82 \times 10^5$  . . . . . page A-20
20. When the C factor assumed in Step 8 is not in agreement with page A-20, for the Reynolds number based on the calculated flow, it must be adjusted until reasonable agreement is reached by repeating Steps 8 to 19.

Flow of Compressible Fluids  
 through Nozzles and Orifices  
 (continued)

# Examples of Flow Problems

## CHAPTER 4

Theory and answers to questions regarding proper application of formulas to flow problems can be presented to good advantage by the solution of practical problems. A few simple flow problems were presented in Chapter 3 to illustrate the use of the nomographs. Other problems, both simple and complex, are presented in this chapter.

Many of the examples given in this chapter employ the basic formulas of Chapters 1 and 2; these formulas were rewritten in more commonly used terms for Chapter 3. Use of nomographs, when applicable, are indicated in the solution of these problems.

The controversial subject regarding the selection of a formula most applicable to the flow of gas through long pipe lines is analyzed in Chapter 1. It is shown that the three commonly used formulas are basically identical, the only difference being in the selection of friction factors. A comparison of results obtained, using the three formulas, is presented in this chapter.

An original method has been developed for the solution of problems involving the discharge of compressible fluids from pipe systems. Illustrative examples applying this method demonstrate the simplicity of handling these, heretofore complex, problems.

### Reynolds Number and Friction Factor For Pipe Other Than Steel

The example below shows the procedure in obtaining the Reynolds number and friction factor for smooth pipe (plastic). The same procedure applies for any pipe other than steel or wrought iron, such as concrete, wood stave, riveted steel, etc. For relative roughness of these and other piping materials, see page A-23.

#### Example 4-1 . . . Smooth Pipe (Plastic)

*Given:* Water at 30 C is flowing through 20 metres of 2-inch standard wall plastic pipe (smooth wall) at a rate of 200 litres per minute.

*Find:* The Reynolds number and friction factor.

*Solution:*

1.  $R_e = \frac{21.22 Q \rho}{d \mu}$  . . . . . page 3-2

2.  $\rho = 995.6$  . . . . . page A-6

3.  $d = 52.5$  . . . . . page B-17

4.  $\mu = 0.8$  . . . . . page A-3

5.  $R_e = \frac{21.22 \times 200 \times 995.6}{52.5 \times 0.8}$

$R_e = 100\ 600$  or  $1.006 \times 10^5$

6.  $f = 0.0177$  for smooth pipe . . . . . page A-24

**Determination of Valve Resistance  
In  $L$ ,  $L/D$ ,  $K$ , and Flow Coefficient  $C_v$**

**Example 4-2 . . .  $L$ ,  $L/D$ , and  $K$  from  $C_v$  for  
Conventional Type Valves**

Given:

A 150 mm (6-inch) Class 125 iron Y-pattern globe valve has a flow coefficient,  $C_v$ , of 600 (US gal/min).

Find: Resistance coefficient  $K$  and equivalent lengths  $L/D$  and  $L$  for flow in zone of complete turbulence.

Solution:

1.  $K$ ,  $L/D$ , and  $L$  should be given in terms of 6-inch Schedule 40 pipe; see page 2-10.
2.  $C_v = \frac{29.9 d^2}{\sqrt{K}}$  or  $K = \frac{891 d^4}{(C_v)^2}$  . . . . . page 3-4  
In this equation  $d$  is in inches (1 inch = 25.4 mm).
3.  $d = 154.1 \text{ mm} \div 25.4 = 6.067''$  . . . . . page B-16
4.  $K = \frac{891 \times 6.067^4}{600^2} = 3.35$  . . . . .  $\left\{ \begin{array}{l} \text{based on 6''} \\ \text{Sched 40 pipe} \end{array} \right.$
5.  $\frac{L}{D} = \frac{K}{f}$  . . . . . page 3-4
6.  $f = 0.015$  . . . . . for 154 mm I.D. pipe in fully turbulent flow range; page A-25
7.  $\frac{L}{D} = \frac{K}{f} = \frac{3.35}{0.015} = 223$   
 $D = 154.1 \div 1000 = 0.1541$  metres
8.  $L = \left(\frac{L}{D}\right)D = 223 \times 0.1541 = 34.4$  metres

**Example 4-3 . . .  $L$ ,  $L/D$  and  $K$  for  
Conventional Type Valves**

Given:

A 100 mm (4-inch) Class 600 steel conventional angle valve with full area seat.

Find: Resistance coefficient  $K$  and equivalent lengths  $L/D$  and  $L$  for flow in zone of complete turbulence.

Solution:

1.  $K$ ,  $L/D$ , and  $L$  should be given in terms of 4-inch Schedule 80 pipe; see page 2-10.
2.  $K = 150 f_T$  . . . . . page A-27  
 $K = f \frac{L}{D}$ ; or  $\frac{L}{D} = \frac{K}{f_T}$  . . . . . page 3-4  
(subscript "T" refers to flow in zone of complete turbulence)
3.  $d = 97.2$  . . . . . page B-16  
 $f_T = 0.017$  . . . . . page A-26
4.  $K = 150 \times 0.017 = 2.55$  . . . . .  $\left\{ \begin{array}{l} \text{based on 4''} \\ \text{Sched. 80 pipe} \end{array} \right.$

**Example 4-3 . . . continued**

5.  $\frac{L}{D} = \frac{2.55}{0.017} = 150$  . . . . .  $\left\{ \begin{array}{l} \text{for graphical solutions} \\ \text{of steps 5 and 6, use} \\ \text{page A-30} \end{array} \right.$
6.  $L = \left(\frac{L}{D}\right)D = \frac{150 \times 97.2}{1000} = 14.6$  metres

**Example 4-4 . . . Venturi Type Valves**

Given:

A 150 x 100 mm (6 x 4-inch) Class 600 steel gate valve with inlet and outlet ports conically tapered from back of body rings to valve ends. Face-to-face dimension is 560 mm and back of seat ring to back of seat ring is about 150 mm.

Find:  $K_2$  for any flow condition, and  $L/D$  and  $L$  for flow in zone of complete turbulence.

Solution:

1.  $K_2$ ,  $L/D$ , and  $L$  should be given in terms of 6-inch Schedule 80 pipe; see page 2-10.
2.  $K_1 = 8 f_T$  . . . . . page A-27  
 $K_2 = \frac{K_1 + \sin \frac{\theta}{2} [0.8 (1 - \beta^2) + 2.6 (1 - \beta^2)^2]}{\beta^4}$   
. . . . . page A-26  
 $K = f \frac{L}{D}$  or  $\frac{L}{D} = \frac{K}{f_T}$  . . . . . page 3-4  
 $\beta = \frac{d_1}{d_2}$  . . . . . page A-26
3.  $d_1 = 101.6$  . . . . . Valve Seat Bore  
 $d_2 = 146.4$  . . . . . 6" Sched. 80 pipe; page B-16  
 $f_T = 0.015$  . . . . . for 6" size; page A-26
4.  $\beta = \frac{101.6}{146.4} = 0.69$        $\beta^2 = 0.48$        $\beta^4 = 0.23$   
 $\tan \frac{\theta}{2} = \frac{0.5(146.4 - 101.6)}{0.5(560 - 150)}$   
 $\tan \frac{\theta}{2} = 0.11 = \sin \frac{\theta}{2}$  approx.
5.  $K_2 = \frac{8 \times 0.015 + 0.11(0.8 \times 0.52 + 2.6 \times 0.52^2)}{0.23}$   
 $K_2 = 1.06$
6.  $\frac{L}{D} = \frac{1.06}{0.015} = 70$  . . . . . diameters 6" Sched. 80 pipe
7.  $L = \frac{70 \times 146.4}{1000} = 10$  metres of 6" Sched. 80 pipe  
(For graphical solution of Steps 6 and 7, see page A-30.)

**Check Valves  
Determination of Size**

**Example 4-5 . . . Lift Check Valves**

*Given:* A globe type lift check valve with a wing-guided disc is required in a 3-inch Schedule 40 horizontal pipe carrying 20 C water at the rate of 300 litres per minute.

*Find:* The proper size check valve and the pressure drop. The valve should be sized so that the disc is fully lifted at the specified flow; see page 2-7 for discussion.

*Solution:*

1.  $v_{\min} = 50 \sqrt{\bar{V}}$  . . . . . page A-27

$v = \frac{21.22 Q}{d^2}$  . . . . . page 3-2

$\Delta p = \frac{0.00225 K \rho Q^2}{d^4}$  . . . . . page 3-4

$K_1 = 600 f_T$  . . . . . page A-27

$K_2 = \frac{K_1 + \beta [0.5 (1 - \beta^2) + (1 - \beta^2)^2]}{\beta^4}$  page A-27

$\beta = \frac{d_1}{d_2}$  . . . . . page A-26

- 2.  $d_1 = 62.7$  . . . for 2½" Sched. 40 pipe; page B-16
- $d_2 = 77.9$  . . . for 3" Sched. 40 pipe; page B-16
- $\bar{V} = 0.001002$  . . . . . 20 C water; page A-6
- $\rho = 998.2$  . . . . . 20 C water; page A-6
- $f_T = 0.018$  . . . . for 2½" or 3" size; page A-26

3.  $v_{\min} = 50 \sqrt{0.001} = 1.585$   
 $v = \frac{21.22 \times 300}{77 \times 92} = 1.05$  for 3" valve

In as much as  $v$  is less than  $v_{\min}$ , a 3-inch valve will be too large. Try a 2½-inch size.

$v = \frac{21.22 \times 300}{62.7^2} = 1.62$  . . . . . for 2½" valve

Based on above, a 2½-inch valve installed in 3-inch Schedule 40 pipe with reducers is advisable.

4.  $\beta = \frac{62.7}{77.9} = 0.80$

$\beta^2 = 0.64$

$\beta^4 = 0.41$

5.  $K_2 = \frac{600 \times 0.018 + 0.8 [0.5 (1 - 0.64) + (1 - 0.64)^2]}{0.41}$

$K_2 = 27$

6.  $\Delta p = \frac{0.00225 \times 27 \times 998.2 \times 300^2}{77.9^4} = 0.148$  bar

**Reduced Port Valves  
Velocity and Rate of Discharge**

**Example 4-6 . . . Reduced Port Ball Valve**

*Given:* Water at 60 F discharges from a tank with 7 metres average head to atmosphere through:

60 metres — 3" Schedule 40 pipe; 6-3" standard 90° threaded elbows; 1-3" flanged ball valve having a 60mm diameter seat, 16° conical inlet, and 30° conical outlet end. Sharp-edged entrance is flush with inside of tank.

*Find:* Velocity of flow in the pipe and rate of discharge in litres per minute.

*Solution:*

1.  $h_L = K \frac{v^2}{2g_n}$  or  $v = \sqrt{\frac{2g_n h_L}{K}}$  . . . . . page 3-4

$v = 21.22 \frac{Q}{d^2}$  or  $Q = 0.047 v d^2$  . . . . . page 3-2

- 2.  $K = 0.5$  . . . . . entrance; page A-29
- $K = 1.0$  . . . . . exit; page A-29
- $f_T = 0.018$  . . . . . page A-26

3. For  $K$  (ball valve), page A-28 indicates use of Formula 5. However, when inlet and outlet angles ( $\theta$ ) differ, Formula 5 must be expanded to:

$K_2 = \frac{K_1 + .8 \sin \frac{\theta}{2} (1 - \beta^2) + 2.6 \sin^2 \frac{\theta}{2} (1 - \beta^2)^2}{\beta^4}$

4.  $\beta = \frac{d_1}{d_2} = \frac{60}{77.9} = 0.77$  . . . . . page A-26

5.  $\sin \theta/2 = \sin 8^\circ = 0.14$  . . . . . valve inlet

6.  $\sin \theta/2 = \sin 15^\circ = 0.26$  . . . . . valve outlet

7.  $K_2 = \frac{3 \times .018 + 0.8 \times 0.14 (1 - 0.77^2)}{0.77^4} + \frac{2.6 \times 0.26 (1 - 0.77^2)^2}{0.77^4} = 0.58$  . . . . . valve

$K = 6 \times 30 f_T = 180 \times 0.018 = 3.24$  6 elbows; p. A-29

$K = f \frac{L}{D} = \frac{0.018 \times 60 \times 1000}{77.9} = 13.9$  pipe; p. 3-4

8. Then, for entire system (entrance, pipe, ball valve, six elbows, and exit),

$K = 0.5 + 13.9 + 0.58 + 3.24 + 1.0 = 19.2$

9.  $v = \sqrt{(19.62 \times 7) \div 19.2} = 2.675$  m/s

$Q = 0.047 \times 2.675 \times 77.9^2 = 763$  litres/min.

10. Calculate Reynolds number to verify that friction factor of 0.018 (zone of complete turbulence) is correct for flow condition . . . or, use "vd" scale at top of Friction Factor chart on page A-25.  
 $vd = 2.675 \times 77.9 = 208$

11. Enter chart on page A-25 at  $vd = 208$ . Note  $f$  for 3-inch pipe is less than 0.02. Therefore, flow is in the transition zone (slightly less than fully turbulent) but the difference is small enough to forego any correction of  $K$  for the pipe.

### Laminar Flow in Valves, Fittings, and Pipe

In flow problems where viscosity is high, calculate the Reynolds Number to determine whether the flow is laminar or turbulent.

#### Example 4-7

*Given:* S.A.E. 10 Lube Oil at 15 C flows through the system described in Example 4-6 at the same differential head.

*Find:* The velocity in the pipe and rate of flow in litres per minute.

*Solution:*

- $$h_L = K \frac{v^2}{2g_n} \dots\dots\dots \text{page 3-4}$$

$$v = \sqrt{\frac{2g_n h_L}{K}}$$

$$v = 21.22 \frac{Q}{d^2} \dots\dots\dots \text{page 3-2}$$

$$Q = 0.047 v d^2$$

$$R_e = \frac{d v \rho}{\mu} \dots\dots\dots \text{page 3-2}$$

$$f = \frac{64}{R_e} \dots\dots \text{pipe, laminar flow; page 3-2}$$

$$K = f \frac{L}{D} \dots\dots\dots \text{pipe; page 3-4}$$
- $K_2 = 0.58 \dots\dots\dots \text{valve; Example 4-6}$ 
 $K = 3.24 \dots\dots\dots \text{6 elbows; Example 4-6}$ 
 $K = 0.5 \dots\dots\dots \text{entrance; Example 4-6}$ 
 $K = 1.0 \dots\dots\dots \text{exit; Example 4-6}$ 
 $\rho = 875.2 \dots\dots\dots \text{page A-7}$ 
 $\mu = 100 \dots\dots\dots \text{page A-3}$ 
 $h_L = 7 \dots\dots\dots \text{Example 4-6}$
- \*Assume laminar flow with  $v = 1.5$

$$R_e = \frac{77.9 \times 1.5 \times 875.2}{100} = 1020$$

$$f = 64 \div 1020 = 0.063 \dots\dots\dots \text{pipe}$$

$$K = \frac{0.063 \times 60 \times 1000}{77.9} = 48.5 \dots\dots \text{pipe}$$

$$K = 48.5 + 0.58 + 3.24 + 0.5 + 1.0$$

$$K = 53.8 \dots\dots\dots \text{entire system}$$
- $$v = \sqrt{\frac{19.62 \times 7}{53.8}} = 1.6 \text{ m/s}$$
- $$Q = 0.047 \times 1.6 \times 77.9^2 = 456 \text{ litres/min.}$$

\*Note: This problem has two unknowns and, therefore, requires a trial-and-error solution. Two or three trial assumptions will usually bring the solution and final assumption into agreement within desired limits.

#### Example 4-8

*Given:* S.A.E. 70 Lube Oil at 40 C is flowing at the rate of 600 barrels per hour through 60 metres of 8-inch Schedule 40 pipe, in which an 8-inch conventional globe valve with full area seat is installed.

*Find:* The pressure drop due to flow through the pipe and valve.

*Solution:*

- $$\Delta p = \frac{0.0158 K \rho B^2}{d^4} \dots\dots\dots \text{page 3-4}$$

$$R_e = \frac{56.23 \rho B}{d \mu} \dots\dots\dots \text{page 3-2}$$
 $K_1 = 340 f_T \dots\dots\dots \text{valve; page A-27}$ 
 $K = f \frac{L}{D} \dots\dots\dots \text{pipe; page 3-4}$ 

$$f = \frac{64}{R_e} \dots\dots\dots \text{pipe}$$
- $S = 0.916 \text{ at } 60 \text{ F (15.6 C)} \dots\dots \text{page A-7}$ 
 $S = 0.90 \text{ at } 40 \text{ C} \dots\dots\dots \text{page A-7}$ 
 $d = 202.7 \dots\dots\dots \text{8" Sched. 40 pipe; page B-16}$ 
 $\mu = 450 \dots\dots\dots \text{page A-3}$ 
 $f_T = 0.014 \dots\dots\dots \text{page A-26}$
- $\rho = 999 \times 0.9 = 899 \dots\dots\dots \text{page A-6, A-7}$ 

$$R_e = \frac{56.23 \times 899 \times 600}{202.7 \times 450} = 332$$
 $R_e < 2000; \text{ therefore flow is laminar.}$
- $$f = \frac{64}{332} = 0.193 \dots\dots\dots \text{pipe}$$
 $K_1 = 340 \times 0.014 = 4.76 \dots\dots\dots \text{valve}$ 

$$K = \frac{0.193 \times 60 \times 1000}{202.7} = 57.13 \dots\dots \text{pipe}$$

$$K = 4.76 + 57.13 = 61.89 \dots\dots \text{total system}$$
- $$\Delta p = \frac{0.0158 \times 61.89 \times 899 \times 600^2}{202.7^4}$$

$$\Delta p = 0.188 \text{ bar}$$

Laminar Flow in Valves, Fittings, and Pipe – continued

In flow problems where viscosity is high, calculate the Reynolds Number to determine whether the flow is laminar or turbulent.

Example 4-9

Given: S.A.E. 70 Lube Oil at 40 C is flowing through 5-inch Schedule 40 pipe at a rate of 2300 litres per minute, as shown in the following sketch.

Find: The velocity in metres per second and pressure difference between gauges  $p_1$  and  $p_2$ .

Solution:

1.  $v = \frac{21.22Q}{d^2}$  ..... page 3-2
- $Re = \frac{21.22Q\rho}{d\mu}$  ..... page 3-2
- $\Delta p = \frac{0.00225 K\rho Q^2}{d^4}$  loss due to flow; page 3-4
- $\Delta p = \frac{h_L\rho}{10200}$  due to elevation change; page 3-5
2.  $K_1 = 8f_T$  ..... gate valve; page A-27
- $K_1 = 150f_T$  ..... angle valve; page A-27
- $K = 20f_T$  ..... elbow; page A-29
- $K = f \frac{L}{D}$  ..... pipe; page 3-4
- $f = \frac{64}{Re}$  ..... pipe; page 3-2
3.  $d = 128.2$  ..... 5" Sched. 40 pipe; page B-16
- $S = 0.916$  at 60 F (15.6 C) ..... page A-7
- $S = 0.90$  at 40 C ..... page A-7
- $\mu = 450$  ..... page A-3
- $\rho = 999 \times 0.9 = 899$  ..... page A-6, A-7
- $f_T = 0.016$  ..... page A-26

4.  $Re = \frac{21.22 \times 2300 \times 899}{128.2 \times 450} = 760$
- $Re < 2000$ ; therefore flow is laminar.
5.  $f = \frac{64}{760} = 0.084$
6. Summarizing  $K$  for the entire system (gate valve, angle valve, elbow, and pipe),
- $K = (8 \times 0.016) + (150 \times 0.016) + (20 \times 0.016)$
- $+ \frac{(0.084 \times 85 \times 1000)}{128.2} = 55.7$
7.  $v = \frac{21.22 \times 2300}{128.2^2} = 2.97 \text{ m/s}$
8.  $\Delta p = \frac{0.00225 \times 55.7 \times 899 \times 2300^2}{128.2^4} + \frac{15 \times 899}{10200}$
- $\Delta p = 3.53 \text{ bar}$  ..... total

Pressure Drop and Velocity in Piping Systems

Example 4-10 . . . Piping Systems - Steam

Given: 40 bar abs. steam at 460 C flows through 120 metres of horizontal 6-inch Schedule 80 pipe at a rate of 40 000 kilograms per hour.

The system contains three 90 degree weld elbows having a relative radius of 1.5, one fully-open 6 x 4-inch Class 600 venturi gate valve as described in Example 4-4, and one 6-inch Class 600 y-pattern globe valve. Latter has a seat diameter equal to 0.9 of the inside diameter of Schedule 80 pipe, disc fully lifted.

Find: The pressure drop through the system.

Solution:

1.  $\Delta p = \frac{0.6253 KW^2 V}{d^4}$  ..... page 3-4
2. For globe valve (see page A-27),  

$$K_2 = \frac{K_1 + \beta [0.5 (1 - \beta^2) + (1 - \beta^2)^2]}{\beta^4}$$

$$K_1 = 55 f_T$$

$$\beta = 0.9$$
3.  $K = 14 f_T$  ..... 90° weld elbows; page A-29  
 $K = f \frac{L}{D}$  ..... pipe; page 3-4  

$$R_e = 354 \frac{W}{d\mu}$$
 ..... page 3-2
4.  $d = 146.4$  ..... 6" Sched. 80 pipe; page B-16  
 $V = 0.081$  ... 40 bar steam 460 C; page A-16  
 $\mu = 0.027$  ..... page A-2  
 $f_T = 0.015$  ..... page A-26
5. For globe valve,  

$$K_2 = \frac{55 \times .015 + .9 [0.5 (1 - .9^2) + (1 - .9^2)^2]}{.9^4}$$

$$K_2 = 1.44$$
6. 
$$R_e = \frac{354 \times 40\,000}{146.4 \times 0.027} = 3.58 \times 10^6$$
  
 $f = 0.015$  ..... pipe; page A-25  

$$K = \frac{0.015 \times 120 \times 1000}{146.4} = 12.3$$
 ..... pipe  
 $K = 3 \times 14 \times 0.015 = 0.63$  3 elbows; page A-29  
 $K_2 = 1.44$  ..... 6 x 4" gate valve; Example 4-4
7. Summarizing  $K$  for the entire system (globe valve, pipe, venturi gate valve, and elbows),  
 $K = 1.44 + 12.3 + 0.63 + 1.44 = 15.8$
8. 
$$\Delta p = \frac{0.6253 \times 15.8 \times 40\,000^2 \times 0.081}{146.4^4} = 2.8 \text{ bar}$$

Example 4-11 . . . Flat Heating Coils - Water

Given: Water at 80 C is flowing through a flat heating coil, shown in the sketch below, at a rate of 60 litres per minute.

Find: The pressure drop from Point A to B.

Solution:

1.  $\Delta p = \frac{0.00225 K_p Q^2}{d^4}$  ..... page 3-4  

$$R_e = \frac{21.22 Q \rho}{d\mu}$$
 ..... page 3-2  
 $K = f \frac{L}{D}$  ..... straight pipe; page 3-4  
 $r/d = 4$  ..... pipe bends  
 $K_{90} = 14 f_T$  ..... 90° bends; page A-29  

$$K_B = (n-1) (.25 \pi f_T \frac{r}{d} + .5 K_{90}) + K_{90}$$
 ..... 180° bends; page A-29
2.  $\rho = 971.8$  ..... water 40 C; page A-6  
 $\mu = 0.35$  ..... water 40 C; page A-3  
 $d = 26.6$  ..... 1" Sched. 40 pipe; page B-16  
 $f_T = 0.023$  ..... 1" Sched. 40 pipe; page A-26
3. 
$$R_e = \frac{21.22 \times 60 \times 971.8}{26.6 \times 0.35} = 1.33 \times 10^5$$
  
 $f = 0.024$  ..... pipe  

$$K = \frac{0.024 \times 5.4 \times 1000}{26.6} = 4.87$$
 5.4m straight pipe  
 $K = 2 \times 14 \times 0.023 = 0.64$  ..... two 90° bends
4. For seven 180° bends,  

$$K_B = 7 [(2-1) (0.25 \pi \times 0.023 \times 4) + (0.5 \times 0.32) + 0.32] = 3.87$$
5.  $K_{TOTAL} = 4.87 + 0.64 + 3.87 = 9.38$
6. 
$$\Delta p = \frac{0.00225 \times 9.38 \times 60^2 \times 971.8}{26.6^4} = 0.152 \text{ bar}$$

Pressure Drop and Velocity in Piping Systems – continued

**Example 4-12 . . . Orifice Size for Given Pressure Drop and Velocity**

*Given:* A 12 inch nominal size, ISO 336 steel pipe, 11 mm. wall thickness, 18 metres long containing a standard gate valve discharges 15 C water to atmosphere from a reservoir. The entrance projects inward into the reservoir and its centre line is 3.5 metres below the water level in the reservoir.

*Find:* The diameter of thin-plate orifice that must be installed in the pipe to restrict the velocity of flow to 3 metres per second when the gate valve is wide open.

*Solution:*

1.  $h_L = K \frac{v^2}{2g_n}$  or System  $K = \frac{2g_n h_L}{v^2}$  page 3-4  
 $R_e = \frac{d v \rho}{\mu}$  ..... page 3-2
2.  $K = 0.78$  ..... entrance; page A-29  
 $K = 1.0$  ..... exit; page A-29  
 $K_1 = 8f_T$  ..... gate valve; page A-27  
 $K = f \frac{L}{D}$  ..... pipe; page 3-4
3.  $d = 301.9$  ..... pipe; page B-20  
 $f_T = 0.013$  ..... pipe; page A-26  
 $\rho = 999.0$  ..... page A-6  
 $\mu = 1.1$  ..... page A-3
4.  $R_e = \frac{301.9 \times 3 \times 999}{1.1} = 8.2 \times 10^5$   
 $f = 0.014$  ..... page A-25
5. Total  $K$  required =  $19.62 \times 3.5 \div 3^2 = 7.63$   
 $K_1 = 8 \times 0.013 = 0.10$  ..... gate valve  
 $K = \frac{18 \times 1000}{301.9} \times 0.013 = 0.84$  ..... pipe  
 Then, exclusive of orifice,  
 $K_{total} = 0.78 + 1.0 + 0.1 + 0.84 = 2.72$
6.  $K_{orifice} = 7.63 - 2.72 = 4.91$
7.  $K_{orifice} \simeq \frac{1 - \beta^2}{C^2 \beta^4}$  ..... page A-20
8. Assume  $\beta = 0.7 \therefore C = 0.7$  page A-20  
 then  $K \simeq 4.3 \therefore \beta$  is too large
9. Assume  $\beta = 0.65 \therefore C = 0.67$  page A-20  
 then  $K \simeq 7.1 \therefore \beta$  is too small
10. Assume  $\beta = 0.69 \therefore C = 0.687$  page A-20  
 then  $K \simeq 4.9 \therefore$  use  $\beta = 0.69$
11. Orifice size  $\simeq 0.69 \times 301.9 = 208$  mm

**Example 4-13 . . . Flow Given in Traditional Units**

*Given:* Fuel oil, with a specific gravity of 0.815 and a kinematic viscosity of 2.7 centistokes flows through a 2-inch Schedule 40 steel pipe, 100 feet long, at a rate of 2 US gallons per second.

*Find:* The pressure drop in bars and in pounds force per square inch.

*Solution:*

1.  $\Delta p = 2.252 \frac{f L \rho Q^2}{d^5}$  ..... page 3-2 or 3-10  
 $R_e = 21\,220 \frac{Q}{v d}$  ..... page 3-2
2. Convert units given to those used in this paper; refer to page B-10.  
 1 ft = 0.3048 m  
 1 US gallon = 3.785 litres
3.  $L = 100$  ft =  $100 \times 0.3048 = 30.48$  m
4.  $d = 52.5$  mm ..... page B-16
5.  $\rho = 999 \times S = 999 \times 0.815$  ..... page A-7  
 $\rho = 814$  kg/m<sup>3</sup>
6. 2 US gallons =  $2 \times 3.785 = 7.57$  litres
7.  $Q = \left( \frac{7.57 \text{ litres}}{\text{sec}} \right) \left( \frac{60 \text{ sec}}{\text{min}} \right) = 454.2$  litres/min
8.  $\nu = 2.7$  centistokes
9.  $R_e = \frac{21\,220 \times 454.2}{2.7 \times 52.5} = 68\,000$  or  $6.8 \times 10^4$
10.  $f = 0.0230$  ..... page A-25
11.  $\Delta p = \frac{2.252 \times 0.0230 \times 30.48 \times 814 \times 454.2^2}{52.5^5}$   
 $\Delta p = 0.665$  bar
12. Pressure drop in pounds force per square inch  
 =  $0.665 \times 14.5$  ..... page B-12  
 =  $9.64$  lbf/in<sup>2</sup>

Pressure Drop and Velocity in Piping Systems - continued

Example 4-14 ... Bernoulli's Theorem - Water

Given: Water at 15 C is flowing through the piping system, shown in the sketch below, at a rate of 1500 litres per minute.

Find: The velocity in both the 4 and 5-inch pipe sizes and the pressure differential between gauges p1 and p2.

Solution:

- Use Bernoulli's theorem (see page 3-2):

$$Z_1 + \frac{10^5 p_1}{\rho_1 g_n} + \frac{v_1^2}{2g_n} = Z_2 + \frac{10^5 p_2}{\rho_2 g_n} + \frac{v_2^2}{2g_n} + h_L$$

Since,  $p_1 = p_2$

$$p_1 - p_2 = \frac{\rho g_n}{10^5} (Z_2 - Z_1) + \frac{v_2^2 - v_1^2}{2g_n} + h_L$$

- $h_L = \frac{22.96 K Q^2}{d^4}$  ..... page 3-4

$$R_e = \frac{21.22 Q \rho}{d \mu}$$
 ..... page 3-2

$$K = f \frac{L}{D}$$
 ..... page 3-4

$$K = \frac{fL}{D\beta^2}$$
 ..... {small pipe, in terms of larger pipe; page 2-11

$$K = 14 f_T$$
 ..... 90° elbow; page A-29

$$K = 14 f_T + \frac{(1 - \beta^2)^2}{\beta^4}$$
 ..... {reducing 90° elbow; page A-26

Note: In the absence of test data for increasing elbows, the resistance is conservatively estimated to be equal to the summation of the resistance due to a straight size 5" elbow and a sudden enlargement (4" to 5").

$$\beta = \frac{d_1}{d_2}$$
 ..... page A-26

- $\rho = 999.0$  ..... page A-6

$$\mu = 1.1$$
 ..... page A-3

$$d_1 = 102.3$$
 ..... 4" Sched. 40 pipe; page B-16

$$d_2 = 128.2$$
 ..... 5" Sched. 40 pipe; page B-16

$$f_T = 0.016$$
 ..... 5" size; page A-26

- $\beta = \frac{102.3}{128.2} = 0.80$

$$Z_2 - Z_1 = 22 - 0 = 22 \text{ metres}$$

$$v_1 = 3.04$$
 ..... 4" pipe, page B-13

$$v_2 = 1.94$$
 ..... 5" pipe, page B-13

$$\frac{v_2^2 - v_1^2}{2g_n} = \frac{1.936^2 - 3.041^2}{2 \times 9.81} = -0.28 \text{ metres}$$

- For Schedule 40 pipe,

$$R_e = \frac{21.22 \times 1500 \times 999}{102.3 \times 1.1} = 2.83 \times 10^5$$
 ..... 4" pipe

$$R_e = \frac{21.22 \times 1500 \times 999}{128.2 \times 1.1} = 2.25 \times 10^5$$
 ..... 5" pipe

$$f = 0.018$$
 ..... 4 or 5" pipe

- $K = \frac{0.018 \times 67 \times 1000}{128.2}$

$$K = 9.4$$
 ..... for 67 m of 5" Sched. 40 pipe

$$K = \frac{0.018 \times 34 \times 1000}{102.3}$$

$$K = 6.0$$
 ..... for 34 m of 4" Sched. 40 pipe

With reference to velocity in 5" pipe,

$$K_2 = 6.0 \div 0.8^4 = 14.6$$
 ..... page 2-11

$$K = 14 \times 0.016 = 0.22$$
 ..... 5" 90° elbow

$$K = 0.22 + \frac{0.36^2}{0.8^4} = 0.54$$
 ..... 5x4" 90° elbow

- Then, in terms of 5-inch pipe,

$$K_{TOTAL} = 9.4 + 14.6 + 0.22 + 0.54 = 24.8$$

- $h_L = \frac{22.96 \times 24.8 \times 1500^2}{128.2^4} = 4.74$

- $p_1 - p_2 = \frac{999 \times 9.81}{10^5} (22 - 0.28 + 4.74)$

$$p_1 - p_2 = 2.6 \text{ bar}$$

Pressure Drop and Velocity in Piping Systems — continued

Example 4-15 . . . Power Required for Pumping

Given: Water at 20 C is pumped through the piping system below at a rate of 400 litres per minute.

Find: The total discharge head (*H*) at flowing conditions and the power demand (brake power) required for a pump having an efficiency (*e<sub>p</sub>*) of 70 per cent.

Solution: 1. Use Bernoulli's theorem (see page 3-2):

$$Z_1 + \frac{10^5 p_1}{\rho_1 g_n} + \frac{v_1^2}{2g_n} = Z_2 + \frac{10^5 p_2}{\rho_2 g_n} + \frac{v_2^2}{2g_n} + h_L$$

2. Since  $\rho_1 = \rho_2$  and  $v_1 = v_2$ , the equation can be rewritten to establish the pump head, *H*:

$$\frac{10^5}{\rho g_n} (p_1 - p_2) = (Z_2 - Z_1) + h_L$$

3.  $h_L = \frac{22.96 KQ^2}{d^4}$  . . . . . page 3-4

$$Re = \frac{dv\rho}{\mu}$$
 . . . . . page 3-2

$$v = \frac{21.22Q}{d^2}$$
 . . . . . page 3-2

Power demand (kW) =  $\frac{QH\rho}{6116 \times 10^3 \times e_p}$  . . . . . page B-21

4.  $K = 30f_T$  . . . . . 90° elbow; page A-29

$K_1 = 8f_T$  . . . . . gate valve; page A-27

$K = f \frac{L}{D}$  . . . . . straight pipe; page 3-4

$K = 1.0$  . . . . . exit; page A-29

5.  $d = 77.9$  . . . . . 3" Sched. 40 pipe; page B-16

$\rho = 998.2$  . . . . . page A-6

$\mu = 0.98$  . . . . . page A-3

$f_T = 0.018$  . . . . . page A-26

6.  $v = \frac{21.22 \times 400}{77.9^2} = 1.4$

$$Re = \frac{77.9 \times 1.4 \times 998.2}{0.98} = 1.1 \times 10^5$$

$f = 0.021$  . . . . . page A-25

7.  $K = 4 \times 30 \times 0.018 = 2.16$  . . . . . four 90° elbows

$K_1 = 8 \times 0.018 = 0.14$  . . . . . gate valve

$K = 27.0$  . . . . . lift check with reducers; Example 4-5

For 150 metres of 3-inch Schedule 40 pipe,

$$K = \frac{0.021 \times 150 \times 1000}{77.9} = 40.4 \text{ and,}$$

$$K_{TOTAL} = 2.16 + 0.14 + 27.0 + 40.4 + 1 = 70.7$$

8.  $h_L = \frac{22.96 \times 70.7 \times 400^2}{77.9^4} = 7$

9.  $H = 120 + 7 = 127$  metres

$$\text{Power demand} = \frac{400 \times 127 \times 998.2}{6116 \times 10^3 \times 0.7} = 11.84 \text{ kW}$$

Example 4-16 . . . Air Lines

Given: Air at 5 bar gauge and 40 C is flowing through 25 metres of 1-inch Schedule 40 pipe at a rate of 3 standard (MSC) cubic metres per minute (see page B-12).

Find: The pressure drop and the velocity at both upstream and downstream gauges.

Solution: 1. Referring to the table on page B-14 read pressure drop of 0.565 bar for 7 bar, 15 C air at a flow rate of 3 cubic metres per minute through 100 metres of 1-inch Schedule 40 pipe.

2. Correction for length, pressure, and temperature (page B-15):

$$\Delta p = 0.565 \left( \frac{25}{100} \right) \left( \frac{7 + 1.013}{5 + 1.013} \right) \left( \frac{273 + 40}{288} \right)$$

$$\Delta p = 0.205 \text{ bar}$$

3. To find the velocity, the rate of flow in cubic metres per minute at flowing conditions must be determined from page B-15.

$$q_m = q'_m \left( \frac{1.013}{1.013 + p} \right) \left( \frac{273 + t}{288} \right)$$

At upstream gauge:

$$q_m = 3 \left( \frac{1.013}{1.013 + 5} \right) \left( \frac{273 + 40}{288} \right) = 0.549$$

At downstream gauge:

$$q_m = 3 \left[ \frac{1.013}{1.013 + (5 - 0.205)} \right] \left( \frac{273 + 40}{288} \right) = 0.569$$

4.  $V = \frac{q_m}{A}$  . . . . . page 3-2

5.  $d = 26.6$  . . . . . page B-16

6.  $A = 0.7854 \left( \frac{26.6}{1000} \right)^2 = 0.000556$

7.  $V = \frac{0.549}{0.000556} = 987 \text{ m/min. (upstream)}$

$$V = \frac{0.569}{0.000556} = 1023 \text{ m/min. (downstream)}$$

Note: Example 4-16 may also be solved by use of the pressure drop formula and nomograph shown on pages 3-2 and 3-21 respectively or the velocity formula and nomograph shown on pages 3-2 and 3-17 respectively.

## Pipe Line Flow Problems

## Example 4-17 . . . Sizing of Pump for Oil Pipe Lines

*Given:* Crude oil 30 degree API at 15.6 C with a viscosity of 75 Universal Saybolt seconds is flowing through a BS 1600, 12 inch, Schedule 30 steel pipe at a rate of 1900 barrels per hour. The pipe line is 80 kilometres long with discharge at an elevation of 600 metres above the pump inlet. Assume the pump has an efficiency of 67 per cent.

*Find:* The power demand of the pump.

*Solution:*

1.  $\Delta p = 15.81 \frac{fL\rho B^2}{d^5}$  } Equation 3-5 on page 3-2  
or, after converting  $B$  to  $Q$ ,  
use nomograph on page 3-11
- $R_e = 56.23 \frac{B\rho}{d\mu}$  ..... page 3-2 or 3-8
- $h_L = \frac{10\,200\,\Delta p}{\rho}$  ..... page 3-5
- power demand (kW) =  $\frac{QH\rho}{6116 \times 10^3 \times e_p}$  ..... page B-21
2.  $t = 15.6\text{ C}$
3.  $\rho = 875.3$  ..... page B-7
- $S = 0.8762$  ..... page B-7
4.  $d = 307.1$  ..... page B-16
5. 75USS = 12.5 centipoise ..... page B-5
6.  $R_e = \frac{56.23 \times 1900 \times 875.3}{307.1 \times 12.5} = 24\,360$
7.  $f = 0.025$  ..... page A-25
8.  $\Delta p = \frac{15.81 \times 0.025 \times 80\,000 \times 875.3 \times 1900^2}{307.1^5}$
- $\Delta p = 36.58$
9.  $h_L = \frac{10\,200 \times 36.58}{875.3} = 426.3$
10. The total discharge head at the pump is:  
 $H = 426.3 + 600 = 1026.3$
11.  $Q = \left(\frac{1900\text{ bbl}}{\text{h}}\right) \times \left(\frac{159\text{ litres}}{\text{bbl}}\right) \times \left(\frac{\text{h}}{60\text{ min}}\right) = 5035$
12. Then the power demand is:  
 $\frac{5035 \times 1026.3 \times 875.3}{6116 \times 10^3 \times 0.67} = 1104$ , say 1110 kW

Pipe Line Flow Problems — continued

Example 4-18 . . . Gas

Given: A natural gas pipe line made of BS 3600 14-inch pipe, wall thickness 11 mm, is 160 kilometres long. The inlet pressure is 90 bar absolute, the outlet pressure is 20 bar absolute and the average temperature is 4°C.

The gas consists of 75% methane (CH<sub>4</sub>), 21% ethane (C<sub>2</sub>H<sub>6</sub>), and 4% propane (C<sub>3</sub>H<sub>8</sub>).

Find: The flow rate in millions of cubic metres per day at Metric Standard Conditions (MSC).

Solutions: Three solutions to this example are presented for the purpose of illustrating the variations in results obtained by use of the Simplified Compressible Flow formula, the Weymouth formula and the Panhandle formula.

Simplified Compressible Flow Formula  
(see page 3-3)

1.  $q'_h = 0.013\ 61 \sqrt{\frac{(p'_1)^2 - (p'_2)^2}{fL_m T S_g}} d^5$
2.  $d = 333.6$  . . . . . page B-20.
3.  $f = 0.0128$  turbulent flow assumed; page A-25
4.  $T = 273 + t = 273 + 4 = 277$
5. Approximate atomic weights:  
Carbon . . . . . C = 12.0  
Hydrogen . . . . . H = 1.0
6. Approximate molecular weights:  
Methane (CH<sub>4</sub>)  
 $M = (1 \times 12.0) + (4 \times 1.0) = 16$   
Ethane (C<sub>2</sub>H<sub>6</sub>)  
 $M = (2 \times 12.0) + (6 \times 1.0) = 30$   
Propane (C<sub>3</sub>H<sub>8</sub>)  
 $M = (3 \times 12.0) + (8 \times 1.0) = 44$   
Natural Gas  
 $M = (16 \times 0.75) + (30 \times 0.21) + (44 \times 0.04)$   
 $M = 20.06$ , or say 20.1
7.  $S_g = \frac{M(\text{gas})}{M(\text{air})} = \frac{20.1}{29} = 0.693$  page 3-5
8.  $q'_h = 0.013\ 61 \sqrt{\frac{(90^2 - 20^2) \times 333.6^5}{0.0128 \times 160 \times 277 \times 0.693}}$   
 $q'_h = 122\ 400$

9.  $q'_d = \left(\frac{122\ 400\ \text{m}^3}{1\ 000\ 000\ \text{kt}}\right) \left(\frac{24\ \text{kt}}{\text{day}}\right) = 2.938$
10.  $Re = \frac{432q'_h S_g}{d\mu}$  . . . . . page 3-2
11.  $\mu = 0.011$  . . . . . estimated; page A-5
12.  $Re = \frac{432 \times 122\ 400 \times 0.693}{333.6 \times 0.011}$   
 $Re = 9\ 986\ 000$  or  $9.986 \times 10^6$
13.  $f = 0.0128$  . . . . . page A-25
14. Since the assumed friction factor ( $f = 0.0128$ ) is correct, the flow rate is 2.938 million m<sup>3</sup>/d at MSC. If the assumed friction factor were incorrect, it would have to be adjusted and Steps 8, 9, 12, and 13 repeated until the assumed friction factor was in reasonable agreement with that based upon the calculated Reynolds number.

Weymouth Formula  
(see page 3-3)

15.  $q'_h = 0.002\ 61 d^{2.667} \sqrt{\frac{(p'_1)^2 - (p'_2)^2}{S_g L_m}} \left(\frac{288}{T}\right)$
16.  $d^{2.667} = 5\ 363\ 000$
17.  $q'_h = 13\ 997 \sqrt{\frac{(90^2 - 20^2)}{0.693 \times 160}} \left(\frac{288}{277}\right)$   
 $q'_h = 118\ 930$
18.  $q'_d = \left(\frac{118\ 930}{1\ 000\ 000\ \text{kt}}\right) \left(\frac{24\ \text{kt}}{\text{day}}\right) = 2.854$

Panhandle Formula  
(see page 3-3)

19.  $q'_h = 0.005\ 06 E d^{2.6182} \left[\frac{(p'_1)^2 - (p'_2)^2}{L_m}\right]^{0.5394}$
20. Assume average operation conditions; then efficiency is 92 per cent:  
 $E = 0.92$
21.  $d^{2.6182} = 4\ 038\ 000$
22.  $q'_h = 18\ 798 \left(\frac{90^2 - 20^2}{160}\right)^{0.5394}$   
 $q'_h = 151\ 910$
23.  $q'_d = \left(\frac{151\ 910}{1\ 000\ 000\ \text{kt}}\right) \left(\frac{24\ \text{kt}}{\text{day}}\right) = 3.646$

Discharge of Fluids from Piping Systems

Example 4-19 . . . Water

Given: Water at 20 C is flowing from a reservoir through the piping system below. The reservoir has a constant head of 3.5 metres.

Find: The flow rate in litres per minute.

Solution: 1.  $Q = 0.2087 d^2 \sqrt{\frac{h_L}{K}}$  .. page 3-4

$R_e = \frac{21.22 Q \rho}{d \mu}$  ..... page 3-2

$\beta = d_1/d_2$  ..... page A-26

2.  $K = 0.5$  ..... entrance; page A-29

$K = 60 f_T$  ..... mitre bend; page A-29

$K_1 = 8 f_T$  ..... gate valve; page A-27

$K = f \frac{L}{D}$  ..... straight pipe; page 3-4

$K_2 = \frac{0.5 (1 - \beta^2) \sqrt{\sin \frac{\theta}{2}}}{\beta^4}$  ..... sudden contraction; page A-26

$K = \frac{fL}{D\beta^4}$  ..... small pipe, in terms of larger pipe; page 2-5

$K = \frac{1}{\beta^4}$  ..... exit from small pipe in terms of larger pipe

3.  $d = 52.5$  ..... 2" Sched. 40 pipe; page B-16

$d = 77.9$  ..... 3" Sched. 40 pipe; page B-16

$\mu = 1.1$  ..... page A-3

$\rho = 998.2$  ..... page A-6

$f_T = 0.019$  ..... 2" pipe; page A-26

$f_T = 0.018$  ..... 3" pipe; page A-26

4.  $\beta = 52.5 \div 77.9 = 0.67$

$K = 0.5$  ..... 3" entrance

$K = 60 \times 0.018 = 1.08$  ..... 3" mitre bend

$K_1 = 8 \times 0.018 = 0.14$  ..... 3" gate valve

$K = \frac{0.018 \times 3 \times 1000}{77.9} = 0.69$  3 metres, 3" pipe

For 6 metres of 2-inch pipe, in terms of 3-inch pipe,

$K = \frac{0.019 \times 6 \times 1000}{52.5 \times 0.67^4} = 10.8$

For 2-inch exit, in terms of 3-inch pipe,

$K = 1 \div 0.67^4 = 5.0$

For sudden contraction,

$K_2 = \frac{0.5 (1 - 0.67^2) (1)}{0.67^4} = 1.37$

and,  $K_{TOTAL} = 0.5 + 1.08 + 0.14 + 0.69 + 10.8 + 5.0 + 1.37 = 19.58$

5.  $Q = 0.2087 \times 77.9^2 \sqrt{3.5 \div 19.58} = 535$   
(this solution assumes flow in fully turbulent zone)

6. Calculate Reynolds numbers and check friction factors for flow in straight pipe of the 2-inch size:

$R_e = \frac{21.22 \times 535 \times 998.2}{52.5 \times 1.1} = 1.96 \times 10^5$

$f = 0.021$  ..... page A-25

and for flow in straight pipe of the 3-inch size:

$R_e = \frac{21.22 \times 535 \times 998.2}{77.9 \times 1.1} = 1.32 \times 10^5$

$f = 0.020$  ..... page A-25

7. Since assumed friction factors used for straight pipe in Step 4 are not in agreement with those based on the approximate flow rate, the  $K$  factors for these items and the total system should be corrected accordingly.

$K = \frac{0.020 \times 3 \times 1000}{77.9} = 0.77$  3 metres, 3" pipe

For 6-metres of 2-inch pipe, in terms of 3-inch pipe,

$K = \frac{0.021 \times 6 \times 1000}{52.5 \times 0.67^4} = 11.9$

and,  $K_{TOTAL} = 0.5 + 1.08 + 0.14 + 0.77 + 11.9 + 5.0 + 1.37 = 20.76$

8.  $Q = 0.2087 \times 77.9^2 \sqrt{3.5 \div 20.76} = 520$  litres/min

Discharge of Fluids from Piping Systems – continued

Example 4-20 . . . Steam at Sonic Velocity

*Given:* A header with 12 bar absolute saturated steam is feeding a pulp stock digester through 10 metres of 2-inch, ISO 336 steel pipe, 4 mm wall thickness, which includes one standard 90 degree elbow and a fully-open conventional plug type disc globe valve. The initial pressure in the digester is atmospheric.

*Find:* The initial flow rate in kilograms per hour, using both the modified Darcy formula and the sonic velocity and continuity equations.

Solutions – for theory, see page 1-9:

Modified Darcy Formula

1.  $W = 1.265Y d^2 \sqrt{\frac{\Delta p}{K\bar{V}_1}}$  . . . . . page 3-4  
 $K = f \frac{L}{D}$  . . . . . pipe; page 3-4
2.  $K_l = 340 f_T$  . . . . . globe valve; page A-27  
 $K = 30 f_T$  . . . . . 90° elbow; page A-29  
 $K = 0.5$  . . . . . entrance from header; page A-29  
 $K = 1.0$  . . . . . exit to digester; page A-29
3.  $\gamma = 1.3$  . . . . . page A-9  
 $d = 52.3$  . . . . . page B-19  
 $f_T = 0.019$  . . . . . page A-26  
 $\bar{V}_1 = 0.1632$  . . . . . page A-13
4.  $K = \frac{0.019 \times 10 \times 1000}{52.3} = 3.63$  10 metres pipe  
 $K_l = 340 \times 0.019 = 6.46$  . . . . . 2" globe valve  
 $K = 30 \times 0.019 = 0.57$  . . . . . 2" 90° elbow  
 and, for the entire system,  
 $K = 3.63 + 6.46 + 0.57 + 0.5 + 1.0 = 12.16$
5.  $\frac{\Delta p}{p'_1} = \frac{12 - 1.013}{12} = \frac{10.987}{12} = 0.916$
6. Using the chart on page A-22 for  $\gamma = 1.3$ , it is found that for  $K = 12.16$  the maximum  $\Delta p/p'_1$  is 0.786 (interpolated from table on page A-22). Since  $\Delta p/p'_1$  is less than indicated in Step 5, sonic velocity occurs at the end of the pipe, and  $\Delta p$  in the equation of Step 1 is:  
 $\Delta p = 0.786 \times 12 = 9.432$ , say 9.43
7.  $Y = 0.710$  . . . . . interpolated from table; page A-22
8.  $W = 1.265 \times 0.71 \times 52.3^2 \sqrt{\frac{9.43}{12.16 \times 0.1632}}$   
 $W = 5356$  kg/h.

Sonic Velocity and Continuity Equations

9.  $v_s = 316.2 \sqrt{\gamma p' \bar{V}}$  . . . . . page 3-3  
 $W = \frac{v d^2}{354 \bar{V}}$  . . . . . Equation 3-2; page 3-2
10.  $p' = p'_1 - \Delta p$   
 $p' = 12 - 9.43 = 2.57$   
 $\Delta p$  determined in Step 6.
11.  $h_g = 2782.7$  . . . 12 bar abs. sat. steam; page A-13
12. At 2.57 bar abs. the temperature of steam with total heat of 2782.7 kJ/kg equals 159 C and  $\bar{V} = 0.7558$
13.  $v_s = 316.2 \sqrt{1.3 \times 2.57 \times 0.7558}$   
 $v_s = 502.4$   
 $W = \frac{502.4 \times 52.3^2}{354 \times 0.7558} = 5136$  kg/h

*NOTE:* In Steps 11 and 12 constant total heat  $h_g$  is assumed. But the increase in specific volume from inlet to outlet requires that the velocity must increase. Source of the kinetic energy increase is the internal heat energy of the fluid. Consequently, the heat energy actually decreases toward the outlet. Calculation of the correct  $h_g$  at the outlet will yield a flow rate commensurate to the answer in Step 8.

Discharge of Fluids from Piping Systems – continued

**Example 4-21 . . . Gases at Sonic Velocity**

*Given:* Coke oven gas having a specific gravity of 0.42, a header pressure of 8.0 bar gauge and a temperature of 60 C is flowing through 6 metres of 3-inch Schedule 40 pipe before discharging to atmosphere. Assume ratio of specific heats,  $\gamma = 1.4$ .

*Find:* The flow rate in cubic metres per hour at Metric Standard Conditions.

*Solution* – for theory, see page 1-9:

1.  $q'_h = 19.31 Y d^2 \sqrt{\frac{\Delta p p'_1}{K T_1 S_g}} \dots$  page 3-4  
 $K = f \frac{L}{D} \dots$  page 3-4
2.  $p'_1 = 8.0 + 1.013 = 9.013$
3.  $f = 0.0175 \dots$  page A-25  
*Note:* The Reynolds number need not be calculated since gas discharged to atmosphere through a short pipe will have a high  $R_e$  and flow will always be in a fully turbulent range, in which the friction factor is constant.
4.  $d = 77.9; D = 0.0779 \dots$  page B-16
5.  $K = f \frac{L}{D} = \frac{0.0175 \times 6}{0.0779} = 1.35 \dots$  for pipe  
 $K = 0.5 \dots$  for entrance; page A-29  
 $K = 1.0 \dots$  for exit; page A-29  
 $K = 1.35 + 0.5 + 1.0 = 2.85 \dots$  total
6.  $\frac{\Delta p}{p'_1} = \frac{9.013 - 1.013}{9.013} = \frac{8}{9.013} = 0.888$
7. Using the chart on page A-22 for  $\gamma = 1.4$ , it is found that for  $K = 2.85$ , the maximum  $\Delta p/p'_1$  is 0.655 (interpolated from table on page A-22). Since  $\Delta p/p'_1$  is less than indicated in Step 6, sonic velocity occurs at the end of the pipe and  $\Delta p$  in Step 1 is:  
 $\Delta p = 0.655 p'_1 = 0.655 \times 9.013 = 5.9$
8.  $T_1 = 60 + 273 = 333$
9.  $Y = 0.636 \dots$  interpolated from table; page A-22
10.  $q'_h$  is equal to:  
 $19.31 \times 0.636 \times 77.9^2 \sqrt{\frac{5.9 \times 9.013}{2.85 \times 333 \times 0.42}}$   
 $q'_h = 27\,200 \text{ m}^3/\text{h}$

**Example 4-22 . . . Compressible Fluids at Subsonic Velocity**

*Given:* Air at a pressure of 1.33 bar gauge and a temperature of 40 C is measured at a point 3 metres from the outlet of a ½-inch Schedule 80 pipe discharging to atmosphere.

*Find:* The flow rate in cubic metres per minute at Metric Standard Conditions.

*Solution:*

1.  $q'_m = 0.3217 Y d^2 \sqrt{\frac{\Delta p p'_1}{K T_1 S_g}} \dots$  page 3-4  
 $K = f \frac{L}{D} \dots$  page 3-4
2.  $p'_1 = 1.33 + 1.013 = 2.343$
3.  $\Delta p = 1.33$
4.  $d = 13.8; D = 0.0138 \dots$  page B-16
5.  $f = 0.0275 \dots$  fully turbulent flow; page A-25
6.  $K = f \frac{L}{D} = \frac{0.0275 \times 3}{0.0138} = 5.98 \dots$  for pipe  
 $K = 1.0 \dots$  for exit; page A-29  
 $K = 5.98 + 1 = 6.98 \dots$  total
7.  $\frac{\Delta p}{p'_1} = \frac{1.33}{2.343} = 0.568$
8.  $Y = 0.76 \dots$  page A-22
9.  $T_1 = 273 + t_1 = 273 + 40 = 313$
10.  $q'_m = 0.3217 \times 0.76 \times 13.8^2 \sqrt{\frac{1.33 \times 2.343}{6.98 \times 313 \times 1.0}}$   
 $q'_m = 1.76 \text{ m}^3/\text{min}$

Flow Through Orifice Meters

Example 4-23 . . . Liquid Service

Given: A square edged orifice of 50 mm diameter is installed in a 102.5 mm inside diameter pipe having a mercury manometer connected between the pipe taps 1 diameter upstream and 0.5 diameter downstream.

Find: (a) The theoretical calibration constant for the meter when used on 15 C water and for the flow range where the orifice flow coefficient C is constant . . . and (b), the flow rate of 15 C water when the mercury deflection is 110 millimetres.

Solution – (a)

1.  $Q = 21.07 d_1^2 C \sqrt{\frac{\Delta p}{\rho}}$  . . . . . page 3-5 or 3-15

$R_e = \frac{21.22 Q \rho}{d \mu}$  . . . . . page 3-2 or 3-8

2. To determine differential pressure across the taps,

$\Delta p = \frac{\Delta h_m \rho}{1000 \times 10\ 200}$  . . . . . page 3-5

where:  $\Delta h_m$  = differential head in millimetres of mercury

3. The weight density of mercury under water equals  $\rho_w (S_{Hg} - S_w)$ , where (at 15 C):

$\rho_w$  = density of water = 999.0 . . . page A-6

$S_{Hg}$  = specific gravity of mercury = 13.57 . . . page A-7

$S_w$  = specific gravity of water = 1.00 . . . page A-6

4. And  $\rho$  of  $H_g$  under  $H_2O$  = 999 (13.57 – 1.00) = 12 557 kg/m<sup>3</sup>

5.  $\Delta p = \frac{\Delta h_m (12\ 557)}{1000 \times 10\ 200} = 0.00123 \Delta h_m$

6.  $d_2$  (larger diam.) = 102.5

7.  $\frac{d_1}{d_2} = \frac{50}{102.5} = 0.49$

8.  $C = 0.625$  . . . . . page A-20

9.  $Q = 21.07 \times 50^2 \times 0.625 \sqrt{\frac{0.00123 \Delta h_m}{999}}$

$Q = 36.5 \sqrt{\Delta h_m}$  . . . . . calibration constant

Solution – (b):

10.  $Q = 36.5 \sqrt{\Delta h_m} = 36.5 \sqrt{110} = 383$

11.  $\mu = 1.1$  . . . . . page A-3

12.  $R_e = \frac{21.22 \times 383 \times 999}{102.5 \times 1.1}$

$R_e = 72\ 000$  or  $7.2 \times 10^4$

13.  $C = 0.625$  is correct for  $R_e = 7.2 \times 10^4$ , per page A-20; therefore, the flow rate through the pipe is 383 litres per minute.

14. When the C factor on page A-20 is incorrect, for the Reynolds number based on calculated flow, it must be adjusted until reasonable agreement is reached by repeating Steps 9, 10, and 12.

Example 4-24 . . . Laminar Flow

In flow problems where the viscosity is high, calculate the Reynolds number to determine the type of flow.

Given: SAE 10 Lube Oil at 32 C is flowing through a 3-inch Schedule 40 pipe and produces 2.8 kPa pressure differential between the pipe taps of a 55 mm I.D. square edged orifice.

Find: The flow rate in litres per minute.

Solution:

1.  $Q = 21.07 d_1^2 C \sqrt{\frac{\Delta p}{\rho}}$  . . . . . page 3-5 or 3-15

$R_e = \frac{21.22 Q \rho}{d \mu}$  . . . . . page 3-2 or 3-8

2.  $\Delta p = 2.8 \div 100 = 0.028$  bar

3.  $\mu = 38$  . . . . . suspect laminar flow; page A-3

4.  $d_2$  (larger diam.) = 77.9 . . . . . page B-16

5.  $\frac{d_1}{d_2} = \frac{55}{77.9} = 0.706$

6.  $C = 0.8$  . . . . . page A-20, assumed value based on laminar flow

7.  $S = 0.876$  at 15 C . . . . . page A-7

$S = 0.87$  at 32 C . . . . . page A-7

8.  $\rho = 999 \times 0.87 = 869$  . . . . . page A-7

9.  $Q = 21.07 \times 55^2 \times 0.8 \sqrt{\frac{0.028}{869}} = 289.5$

10.  $R_e = \frac{21.22 \times 289.5 \times 869}{77.9 \times 38} = 1803$

11.  $C = 0.9$  for  $R_e = 1803$  . . . . . page A-20

Since the assumed C value of 0.8 is not correct, it must be adjusted by repeating Steps 6, 7, 8 and 9.

12.  $C = 0.87$  . . . . . assumed; page A-20

13.  $Q = 21.07 \times 55^2 \times 0.87 \sqrt{\frac{0.028}{869}} = 315$

14.  $R_e = \frac{21.22 \times 315 \times 869}{77.9 \times 38} = 1960$

15.  $C = 0.87$  for  $R_e = 1960$  . . . . . page A-20

Since  $C = 0.87$  is correct for the flow, the flow through the meter is 315 litres per minute.

**Application of Hydraulic Radius to Flow Problems**

**Example 4-25 . . . Rectangular Duct**

*Given:* A rectangular concrete overflow aqueduct 7.6 metres high and 5 metres wide, has an absolute roughness ( $\epsilon$ ) of 3 millimetres.

*Find:* The discharge rate in cubic metres per second when the liquid in the reservoir has reached the maximum height indicated in the above sketch. Assume the average temperature of the water is 15 C.

*Solution:*

1. 
$$h_L = \frac{v^2}{2g_n} (K_e + K_a) = \frac{v^2}{2g_n} \left( K_e + \frac{fL}{4R_H} \right)$$

2. 
$$v = \frac{q}{A}$$

3. 
$$q = 3.478 \times 10^{-6} d^2 \sqrt{\frac{h_L}{K_e + K_a}} \quad \dots \text{page 3-4}$$

$$q = 4.428A \sqrt{\frac{h_L}{K_e + K_a}}$$

$$q = 4.428A \sqrt{\frac{h_L}{K_e + \frac{fL}{4R_H}}}$$

where:  $K_e$  = resistance of entrance and exit  
 $K_a$  = resistance of aqueduct

To determine the friction factor from the Moody diagram, an equivalent diameter four times the hydraulic radius is used; refer to page 3-5.

$$R_H = \frac{\text{cross sectional flow area}}{\text{wetted perimeter}}$$

$$R_e = 318.3 \frac{q\rho}{R_H\mu} \quad \dots \text{page 3-2}$$

4. Assuming a sharp edged entrance,  
 $K = 0.5 \quad \dots \text{page A-29}$   
 Assuming a sharp edged exit to atmosphere,  
 $K = 1.0 \quad \dots \text{page A-29}$   
 Then, resistance of entrance and exit,  
 $K_e = 0.5 + 1.0 = 1.5$

5. 
$$R_H = \frac{5 \times 7.5}{2(5 + 7.5)} = 1.5 \text{ m}$$

6. Equivalent diameter relationship:  
 $D = 4R_H = 4 \times 1.5 = 6 \quad \dots \text{page 3-5}$   
 $d = 4000 R_H = 4000 \times 1.5 = 6000 \quad \text{page 3-5}$

7. Relative roughness,  $\epsilon/d = 0.0005 \dots \text{page A-23}$   
 8.  $f = 0.017$  fully turbulent flow assumed; page A-23

9. 
$$q = 4.428 \times 7.5 \times 5 \sqrt{1.5 + \frac{0.017 \times 300}{6}}$$

$$q = 839 \text{ m}^3/\text{s}$$

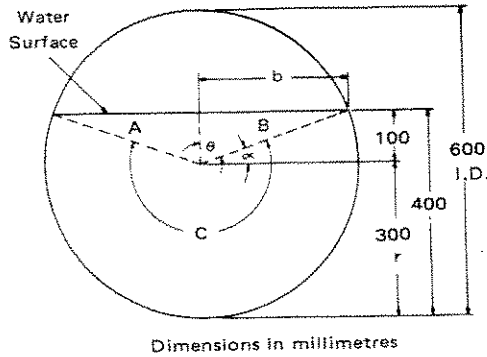

10. Calculate  $R_e$  and check,  $f = 0.017$  for  $q = 839 \text{ m}^3/\text{s}$  flow  
 11.  $\rho = 999 \quad \dots \text{page A-6}$   
 12.  $\mu = 1.1 \quad \dots \text{page A-3}$   
 13. 
$$R_e = \frac{318.3 \times 839 \times 999}{1.5 \times 1.1}$$
  

$$R_e = 162\,000\,000 \text{ or } 1.62 \times 10^8$$
  
 14.  $f = 0.017 \quad \dots \text{for calculated } R_e; \text{ page A-24}$   
 15. Since the friction factor assumed in Step 8 and that determined in Step 14 are in agreement, the discharge flow will be  $839 \text{ m}^3/\text{s}$   
 16. If the assumed friction factor and the friction factor based on the calculated Reynolds number were not in reasonable agreement, the former should be adjusted and calculations repeated until reasonable agreement is reached.

Application of Hydraulic Radius to Flow Problems – continued

Example 4-26 . . . Pipe Partially Filled With Flowing Water

Given: A cast iron pipe is two-thirds full of steady, uniform flowing water (15 C). The pipe has an inside diameter of 600 mm and a slope of 1 in 16. See sketch below.

Find: The flow rate in litres per minute.

Solution:

1.  $Q = 0.2087d^2 \sqrt{\frac{h_L D}{fL}}$  . . . . . page 3-4

Since pipe is flowing partially full an equivalent diameter based upon hydraulic radius is substituted for  $D$  in Equation 1 (see page 1-4).

$D = 4R_H$  . . . . . page 3-5

2.  $Q = 0.2087d^2 \sqrt{\frac{h_L 4R_H}{fL}} = 0.4174d^2 \sqrt{\frac{h_L R_H}{fL}}$

3.  $R_H = \frac{\text{cross sectional flow area}}{\text{wetted perimeter}}$  . . page 3-5

4.  $R_e = 0.0053 \frac{Q\rho}{R_H\mu}$  . . . . . page 3-2

5. Depth of flowing water equals:

$\frac{2}{3} (600) = 400 \text{ mm}$

6.  $\cos \theta = \frac{100}{300} = 0.333$

$\theta = 70^\circ 32'$

$\alpha = 90^\circ - 70^\circ 32' = 19^\circ 28' = 19.47^\circ$

7. Area C =  $\frac{\pi d^2}{4} \left[ \frac{180 + (2 \times 19.47)}{360} \right]$

Area C =  $\frac{\pi 600^2}{4} \left( \frac{218.94}{360} \right) = 172\,000 \text{ mm}^2$

8.  $b = \sqrt{300^2 - 100^2} = 283 \text{ mm}$

9. Area A = Area B =  $\frac{1}{2} (100 \times 283)$

Area A or B =  $14\,150 \text{ mm}^2$

10. The cross sectional flow area equals:

$A+B+C = (2 \times 14\,150) + 172\,000$

$A+B+C = 200\,300 \text{ mm}^2 \text{ or } 0.2003 \text{ m}^2$

11.  $d^2 = \frac{4a}{\pi} = \frac{4 \times 200\,300}{\pi} = 255\,000$

12.  $h_L = \Delta h = \frac{1}{16} = 0.0625 \text{ metre per metre}$

13. The wetted perimeter equals:

$\pi d \left( \frac{218.94}{360} \right)$

$\pi 600 \left( \frac{218.94}{360} \right) = 1146 \text{ mm}$   
 $= 1.146 \text{ m}$

14.  $R_H = \frac{0.2003}{1.146} = 0.175 \text{ m}$

15. Equivalent diameter  $d = 4000 R_H$  . . page 3-5

$d = 4000 \times 0.175 = 700$

16. Relative roughness  $\frac{\epsilon}{d} = 0.00036$  . . . page A-23

17.  $f = 0.0156$

{ assuming fully turbulent flow; page A-23

18.  $Q = 0.4174 \times 255\,000 \sqrt{\frac{0.0625 \times 0.175}{0.0156 \times 1}}$

$Q = 89\,000 \text{ litres/min.}$

19. Calculate the Reynolds number to check the friction factor assumed in Step 17.

20.  $\rho = 999$  . . . . . page A-6

21.  $\mu = 1.1$  . . . . . page A-3

22.  $R_e = \frac{0.0053 \times 89\,000 \times 999}{0.175 \times 1.1}$

$R_e = 2\,450\,000 \text{ or } 2.45 \times 10^6$

23.  $f = 0.0156$  . . . . . page A-24

24. Since the friction factor assumed in Step 17 and that determined in Step 23 are in agreement, the flow rate will be 89 000 litres/min.

25. If the assumed friction factor and the friction factor based on the calculated Reynolds number, were not in reasonable agreement, the former should be adjusted and the calculations repeated until reasonable agreement is reached.

# Physical Properties of Fluids and Flow Characteristics of Valves, Fittings, and Pipe

## APPENDIX A

The physical properties of many commonly used fluids are required for the solution of flow problems. This appendix presents a compilation of such properties obtained from various reference sources. In those cases where the information given by the source reference is in Imperial units this has been converted and is presented here in terms of SI units.

Most texts on the subject of fluid mechanics cover in detail the flow through pipe, but the flow characteristics of valves and fittings are given little, if any, attention, probably because the information has not been available. This appendix includes a presentation of data which provides a basis for calculating the resistance coefficient ' $K$ ' for various types of valves and fittings and the method of employing this coefficient to obtain pressure drop or head loss through valves and fittings is explained in Chapter 2.

The  $Y$  net expansion factors for discharge of compressible fluids from piping systems, which are presented here, provide means for a greatly simplified solution of a heretofore complex problem.

Viscosity of Water and Steam<sup>2</sup> — in centipoise ( $\mu$ )

Viscosity of Gases and Vapours

The curves for hydrocarbon vapours and natural gases in the chart at the upper right are adapted from data taken from Maxwell<sup>15</sup>; the curves for all other gases (except helium<sup>27</sup>) in the chart are based upon Sutherland's formula, as follows:

$$\mu = \mu_0 \left( \frac{T_0 + C}{T + C} \right) \left( \frac{T}{T_0} \right)^{3/2}$$

where:

$\mu$  = viscosity, in centipoise at temperature  $T$ .

$\mu_0$  = viscosity, in centipoise at temperature  $T_0$ .

$T$  = absolute temperature, in Kelvin ( $273 + ^\circ\text{C}$ ), for which viscosity is required.

$T_0$  = absolute temperature, in Kelvin, for which viscosity is known.

$C$  = Sutherland's constant.

**Note:** The variation of viscosity with pressure is small for most gases. For gases given on this page, the correction of viscosity for pressure is less than 10 per cent for pressures up to 35 bar.

Fluid	Approximate Values of "C"
O <sub>2</sub>	127
Air	120
N <sub>2</sub>	111
CO <sub>2</sub>	240
CO	118
SO <sub>2</sub>	416
NH <sub>3</sub>	370
H <sub>2</sub>	72

**Upper chart example:** The viscosity of sulphur dioxide gas (SO<sub>2</sub>) at 100°C is 0.0162 centipoise.

**Lower chart example:** The viscosity of carbon dioxide gas (CO<sub>2</sub>) at about 30°C is 0.0152 centipoise.

**Physical Properties of Water**

To convert Specific Volume from cubic decimetres per kilogram ( $\text{dm}^3/\text{kg}$ ) to cubic metres per kilogram ( $\text{m}^3/\text{kg}$ ) divide values in table by  $10^3$ .

To convert Density from kilograms per cubic metre ( $\text{kg}/\text{m}^3$ ) to kilograms per litre ( $\text{kg}/\text{litre}$ ) divide values in table by  $10^3$ .

Specific gravity of water at  $15^\circ\text{C} = 1.00$ .

Data on pressure and volume abstracted from UK National Engineering Laboratory "Steam Tables 1964" with permission of HMSO.

**Specific Gravity-Temperature Relationship for Petroleum Oils**

(Adapted from bibliography reference 12 data)

C<sub>2</sub>H<sub>6</sub> = Ethane  
 C<sub>3</sub>H<sub>8</sub> = Propane iC<sub>4</sub>H<sub>10</sub> = Isobutane  
 C<sub>4</sub>H<sub>10</sub> = Butane iC<sub>5</sub>H<sub>12</sub> = Isopentane

Example: The specific gravity of an oil at 15.6 C is 0.85. The specific gravity at 50 C = 0.83.

To find the density in kilograms/cubic metre of a petroleum oil at its flowing temperature when the specific gravity at 60 F/60 F (15.6 C/15.6 C) is known, multiply the specific gravity of the oil at flowing temperature (see chart above) by 999, the density of water at 60 F (15.6 C).

(a) Representative values; exact characteristics require knowledge of exact constituents.

Notes. To obtain density values at 15°C, 1.01325 bar, multiply table values by 1.0174.

Where the Kelvin (K) appears in the above table it may be replaced by the degree Celsius (°C) i.e. kJ/kg K may be written kJ/kg°C.

Values of Molecular Weight, Specific Gravity, Individual Gas Constant and Specific Heat abstracted from or based on Table 24 in Mark's "Standard Handbook for Mechanical Engineers", Seventh Edition, 1966 – approximate values adapted from a number of sources.<sup>22</sup>Values of Densities obtained by multiplying density of dry air at 20°C, 1.01325 bar, by specific gravity of gas, i.e. 1.2045 ×  $S_g$ . Density of air, from "Thermodynamic and Transport Properties of Fluids", Y. R. Mayhew and G. F. C. Rogers, 1972.<sup>14</sup>

Steam - Values of Isentropic Exponent,  $\gamma^{20}$

For small changes in pressure (or volume) along an isentropic,  $pV^\gamma = \text{constant}$

### Density and Specific Volume Of Gases and Vapours

The chart on page A-11 is based on the formula:

$$\rho = \frac{10^5 p'}{RT} = \frac{12.03 M p' S_g}{T} = \frac{349 p' S_g}{T}$$

where:  $p' = 1.013 + p'$   
 $T = 273 + t$

Universal Gas Constant = 8314

Molecular weight of air = 29

**Problem:** What is the density of dry CH<sub>4</sub> if the temperature is 40°C and the gauge pressure is 1 bar?

**Solution:** Refer to the table on page A-8 for molecular weight, specific gravity or individual gas constant. Connect 519 of the *R* scale with 40 on the temperature scale, *t*, and mark the intersection with the index scale. Connect this point with 1 on the pressure scale, *p*. Read the answer, 1.24 kilograms per cubic metre, on the density scale,  $\rho$ .

Density of Air

Air Temp. °C	Density of Air in Kilograms per Cubic Metre For Pressures in Bar Gauge Indicated (Based on an atmospheric pressure of 1.013 25 bar and a molecular weight of 28.97)

Air Density Table

The table at the left is calculated for the perfect gas law shown at the top of the page. Correction for super-compressibility, the deviation from the perfect gas law, would be less than three percent and has not been applied.

The density of gases other than air can be determined from this table by multiplying the density listed for air by the specific gravity of the gas relative to air, as listed in the tables on page A-8.

Density and Specific Volume  
of Gases and Vapours - continued

For application of chart, refer to the explanation on the preceding page.

Molecular weight, specific gravity, and individual constants for various gases are given on page A-8.

Volumetric Composition and Specific Gravity\* of Gaseous Fuels<sup>13, 30</sup>

Type of Gas	Chemical Composition Percent by Volume											Specific Gravity relative to Air to Air S <sub>g</sub>	
	Hydrogen	Carbon Monoxide	Methane	Ethane	Propane	Pentanes and above	Butane	Ethylene	Benzene	Oxygen	Nitrogen		Carbon Dioxide
1 Natural Gas, Pittsburgh			83.4	15.8							0.8		0.61
2 Producer Gas from Bituminous Coal	14.0	27.0	3.0						0.6	50.9	4.5		0.86
3 Blast Furnace Gas	1.0	27.5								60.0	11.5		1.02
4 Blue Water Gas from Coke	47.3	37.0	1.3						0.7	8.3	5.4		0.57
5 Carbureted Water Gas	40.5	34.0	10.2				6.1	2.8	0.5	2.9	3.0		0.63
6 Coal Gas (Cont. Vertical Retorts)	54.5	10.9	24.2				1.5	1.3	0.2	4.4	3.0		0.42
7 Coke-Oven Gas	46.5	6.3	32.1				3.5	0.5	0.8	8.1	2.2		0.44
8 Refinery Oil Gas (Vapour Phase)	13.1	1.2	23.3	21.7			39.6		1.0		0.1		0.89
9 Oil Gas, Pacific Coast	48.6	12.7	26.3				2.7	1.1	0.3	3.6	4.7		0.47

These tables of properties of saturated and superheated steam have been extracted from "Steam Tables in S.I. Units—Thermodynamic Properties of Water and Steam" by permission of the authors and publishers, the Central Electricity Generating Board.

## Units and Notation

Quantity	Symbol	Unit
Pressure	$p$	bar ( $10^5 \text{N/m}^2$ ) abs.
Temperature	$t$	°C
Specific Volume	$v$	$\text{dm}^3/\text{kg}$ ( $10^{-3} \text{m}^3/\text{kg}$ )
Specific Enthalpy	$h$	$\text{kJ/kg}$ ( $10^3 \text{J/kg}$ )

The following suffixes are used for saturation values:

$s$	saturation
$f$	saturated liquid
$g$	saturated vapour
$fg$	evaporation increment

Absolute pressure = Gauge pressure + 1.013 bar approx.  
One bar =  $10^5 \text{N/m}^2 = 14.51 \text{bf/in}^2$  approx.

## Properties of Superheated Steam

 $\bar{v}$  = specific volume, cubic decimetres per kilogram

h = specific enthalpy (total heat), kilojoules per kilogram

Note. To convert  $\bar{v}$  dm<sup>3</sup>/kg to  $\bar{V}$  m<sup>3</sup>/kg divide values of  $\bar{v}$  by 10<sup>3</sup>

Flow Coefficient C for Nozzles<sup>9</sup>

$$C = \frac{C_d}{\sqrt{1 - \beta^4}}$$

Example: The flow coefficient  $C$  for a diameter ratio  $\beta$  of 0.60 at a Reynolds number of 20 000 ( $2 \times 10^4$ ) equals 1.03.

Flow Coefficient C for Square-Edge Orifices<sup>9,17</sup>

$$C = \frac{C_d}{\sqrt{1 - \beta^4}}$$

$$K_{\text{orifice}} \approx \frac{1 - \beta^2}{C^2 \beta^4}$$

**Net Expansion Factor,  $Y$**   
**For Compressible Flow through**  
**Nozzles and Orifices<sup>2</sup>**

$\gamma = 1.3$  approximately

(for CO<sub>2</sub>, SO<sub>2</sub>, H<sub>2</sub>O, H<sub>2</sub>S, NH<sub>3</sub>, N<sub>2</sub>O, Cl<sub>2</sub>, CH<sub>4</sub>, C<sub>2</sub>H<sub>2</sub>, and C<sub>2</sub>H<sub>4</sub>)

**Critical Pressure Ratio,  $r_c$**

**For Compressible Flow through**  
**Nozzles and Venturi Tubes<sup>2</sup>**

$\gamma = 1.4$  approximately

(for Air, H<sub>2</sub>, O<sub>2</sub>, N<sub>2</sub>, CO, NO, and HCl)

$$\frac{\Delta p}{p'_1} = \frac{\Delta P}{P'_1} \quad \frac{p'_2}{p'_1} = \frac{P_2}{P_1}$$

**Net Expansion Factor Y for Compressible Flow  
Through Pipe to a Larger Flow Area**

$\gamma = 1.3$

( $\gamma =$  approximately 1.3 for  $\text{CO}_2, \text{SO}_2, \text{H}_2\text{O}, \text{H}_2\text{S}, \text{NH}_3, \text{N}_2\text{O}, \text{Cl}_2, \text{CH}_4, \text{C}_2\text{H}_2,$  and  $\text{C}_2\text{H}_4$ )

**Limiting Factors  
For Sonic Velocity  
 $\gamma = 1.3$**

### Relative Roughness of Pipe Materials and Friction Factors For Complete Turbulence

(Absolute Roughness  
is in millimetres)

Adapted from data extracted  
from Bibliography reference 18

**Problem:** Determine absolute and relative roughness, and friction factor, for fully turbulent flow in a cast iron pipe, 250 mm int. diam.

**Solution:** Absolute roughness ( $\epsilon$ ) = 0.26 . . . . . Relative roughness ( $\epsilon/d$ ) = 0.001 . . . . . Friction factor at fully turbulent flow ( $f$ ) = 0.0196.

Friction Factors for Any Type of Commercial Pipe

**Problem:** Determine the friction factor for a cast iron pipe 250 mm int. diam. at a Reynolds number flow of 30,000.

**Solution:** The relative roughness (see page A-23) is 0.001. Then, the friction factor ( $f$ ) equals 0.026.

For other forms of the  $R_e$  equation, see page 3-2.

Adapted from data extracted from Bibliography reference 18.

Friction Factors for Clean Commercial Steel Pipes

The above diagram relates to steel pipes to ANSI 36.10 and BS 1600 and indicates the inside diameters of these pipes for various Schedule Numbers.  
For other clean commercial steel pipes ascertain inside diameter and use main chart only.

Adapted from data extracted from Bibliography reference 18.

**Problem:** Determine the friction factor for 12-inch Schedule 40 pipe at a flow having a Reynolds number of 300 000.

$$Re = \frac{d v \rho}{\mu} = \text{Reynolds Number}$$

For other forms of the  $Re$  equation, see page 3-2.

**Solution:** The friction factor ( $f$ ) equals 0.016.

"K" FACTOR TABLE — SHEET 1 of 4

Representative Resistance Coefficients (K) for Valves and Fittings

("K" is based on use of schedule pipe as listed on page 2-10)

PIPE FRICTION DATA FOR CLEAN COMMERCIAL STEEL PIPE WITH FLOW IN ZONE OF COMPLETE TURBULENCE

Friction Factor ( $f_f$ )		.027	.025	.023	.022	.021	.019	.018	.017	.016	.015	.014	.013	.012

FORMULAS FOR CALCULATING "K" FACTORS\* FOR VALVES AND FITTINGS WITH REDUCED PORT (Ref. pages 2-11 and 3-4)

Formula 1

$$K = \frac{0.8 \left( \sin \frac{\theta}{2} \right) (1 - \beta^2)}{\beta^4} = \frac{K_1}{\beta^4}$$

Formula 2

$$K_2 = \frac{0.5 (1 - \beta^2) \sqrt{\sin \frac{\theta}{2}}}{\beta^4} = \frac{K_1}{\beta^4}$$

Formula 3

$$K_2 = \frac{2.6 \left( \sin \frac{\theta}{2} \right) (1 - \beta^2)^2}{\beta^4} = \frac{K_1}{\beta^4}$$

Formula 4

$$K_2 = \frac{(1 - \beta^2)^2}{\beta^4} = \frac{K_1}{\beta^4}$$

Formula 5

$$K_2 = \frac{K_1}{\beta^4} + \text{Formula 1} + \text{Formula 3}$$

$$K_2 = \frac{K_1 + \sin \frac{\theta}{2} [0.8 (1 - \beta^2) + 2.6 (1 - \beta^2)^2]}{\beta^4}$$

Formula 6

$$K_2 = \frac{K_1}{\beta^4} + \text{Formula 2} + \text{Formula 4}$$

$$K_2 = \frac{K_1 + 0.5 \sqrt{\sin \frac{\theta}{2} (1 - \beta^2) + (1 - \beta^2)^2}}{\beta^4}$$

$$K_2 = \frac{K_1}{\beta^4} + \beta (\text{Formula 2} + \text{Formula 4}) \text{ when } \theta = 180^\circ$$

$$K_2 = \frac{K_1 + \beta [0.5 (1 - \beta^2) + (1 - \beta^2)^2]}{\beta^4}$$

$$\beta = \frac{d_1}{d_2}$$

$$\beta^2 = \left( \frac{d_1}{d_2} \right)^2 = \frac{a_1}{a_2}$$

Subscript 1 defines dimensions and coefficients with reference to the smaller diameter.

Subscript 2 refers to the larger diameter.

\*Use K furnished by valve or fitting supplier when available

SUDDEN AND GRADUAL CONTRACTION

If:  $\theta < 45^\circ$  .....  $K_2 = \text{Formula 1}$

$45^\circ < \theta < 180^\circ$  ....  $K_2 = \text{Formula 2}$

SUDDEN AND GRADUAL ENLARGEMENT

If:  $\theta < 45^\circ$  .....  $K_2 = \text{Formula 3}$

$45^\circ < \theta < 180^\circ$  ....  $K_2 = \text{Formula 4}$

"K" FACTOR TABLE - SHEET 2 of 4

Equivalent Lengths  $L$  and  $L/D$  and Resistance Coefficient  $K$

Solution

Valve Size	80 mm	300 mm	Refer to
Equivalent length, pipe diameters	8	8	Page A-27
Equivalent length, metres of Sched. 40 pipe	0.62	2.43	Dotted lines
Resist Factor $K$ , based on Sched. 40 pipe	0.14	0.10	on chart

**Problem:** Find the equivalent length in pipe diameters and metres of Schedule 40 clean commercial steel pipe, and the resistance factor  $K$  for 80 mm and 300 mm fully opened gate valves, ANSI Class 300, with flow in zone of complete turbulence.

For discussion on  $L/D$  and  $K$  see pages 2-8 to 2-10

# Engineering Data

## APPENDIX B

This section includes a number of tables and nomographs for conversion to units other than the SI units generally used in this paper. A summary of SI units, prefixes and symbols is also presented.

Tables of dimensions of steel pipe to ANSI, BS and ISO standards are provided as well as complete solutions of water and air flow pressure drop problems.

### Equivalent Volume and Mass Flow Rates of Compressible Fluids at Metric Standard Conditions

### Equivalents of Absolute (Dynamic) Viscosity

TO OBTAIN → MULTIPLY ↓ BY ↘	Pascal second Pa s	Centipoise cP	Poundal second per square foot pdl s/ft <sup>2</sup>	Pound-force second per square foot lbf s/ft <sup>2</sup>	Kilogram-force second per square metre kgf s/m <sup>2</sup>
1 pascal second (= 1 N s/m <sup>2</sup> ) Pa s	1	1000	0.672	2.09 x 10 <sup>-3</sup>	0.102
1 centipoise cP	0.001	1	6.72 x 10 <sup>-4</sup>	2.09 x 10 <sup>-3</sup>	1.02 x 10 <sup>-4</sup>
1 poundal second per square foot (= 1 lb/(ft s)) pdl s/ft <sup>2</sup>	1.488	1488	1	0.031	0.152
1 pound-force second per square foot (= 1 slug/(ft s)) lbf s/ft <sup>2</sup>	47.88	47 880	32.174	1	4.882
1 kilogram-force second per square metre kgf s/m <sup>2</sup>	9.807	9807	6.590	0.205	1

To convert absolute or dynamic viscosity from one set of units to another, locate the given set of units in the left hand column and multiply the numerical value by the factor shown horizontally to the right under the set of units desired.

Example. Convert an absolute viscosity of 0.0014 slugs/foot second to centipoise. The conversion factor is seen to be 47 880. Then 0.0014 times 47 880 = 67 centipoise.

### Equivalents of Kinematic Viscosity

TO OBTAIN → MULTIPLY ↓ BY ↘	Metre squared per second m <sup>2</sup> /s	Centistokes cSt	Inch squared per second in <sup>2</sup> /s	Foot squared per second ft <sup>2</sup> /s
1 metre squared per second m <sup>2</sup> /s	1	1 x 10 <sup>6</sup>	1550	10.764
1 centistokes cSt	1 x 10 <sup>-6</sup>	1	1.55 x 10 <sup>-3</sup>	1.0764 x 10 <sup>-5</sup>
1 inch squared per second in <sup>2</sup> /s	6.452 x 10 <sup>-4</sup>	645.2	1	6.944 x 10 <sup>-3</sup>
1 foot squared per second ft <sup>2</sup> /s	9.290 x 10 <sup>-2</sup>	92 903	144	1

To convert kinematic viscosity from one set of units to another, locate the given set of units in the left hand column and multiply the numerical value by the factor shown horizontally to the right, under the set of units desired.

Example. Convert a kinematic viscosity of 0.5 foot squared/second to centistokes. The conversion factor is seen to be 92 903. Then 0.5 times 92 903 = 46 451 centistokes.

### Equivalents of Kinematic, Saybolt Universal, Saybolt Furol, and Absolute Viscosity

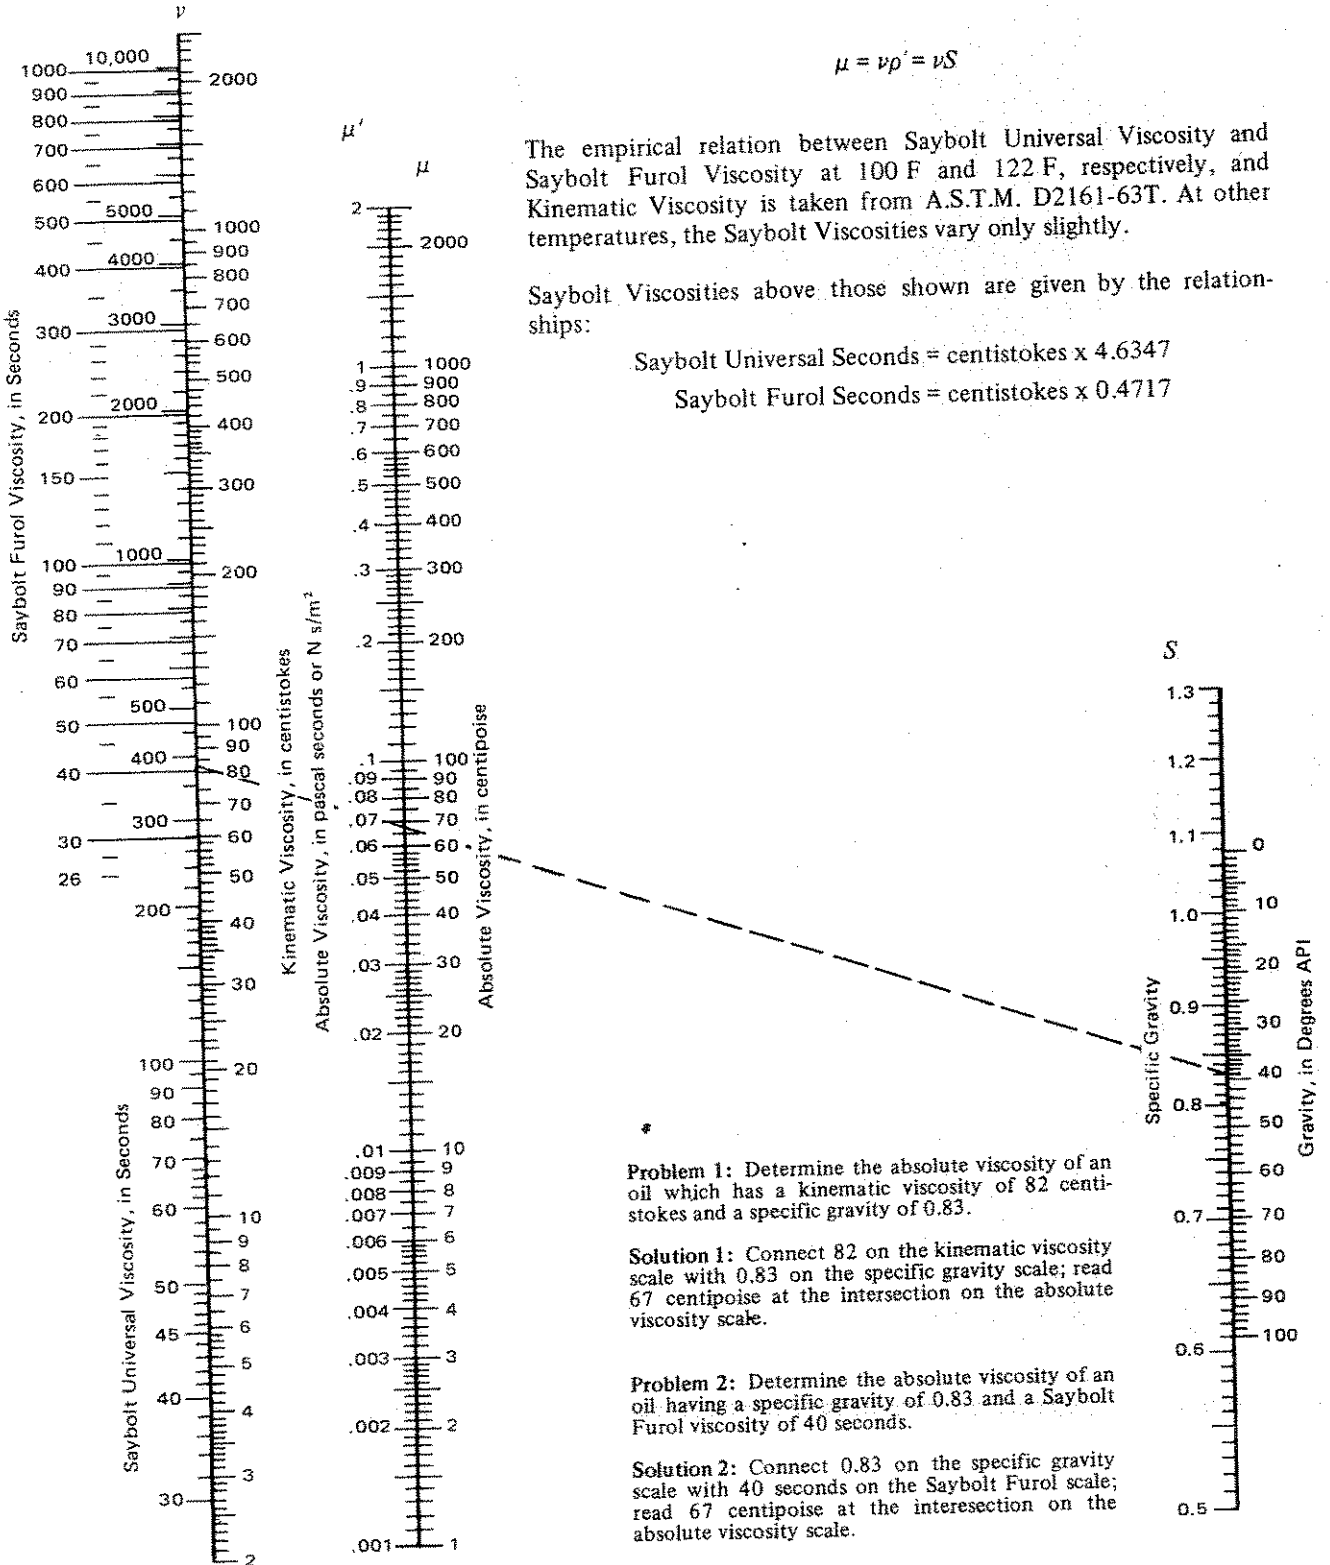

$$\mu = \nu \rho = \nu S$$

The empirical relation between Saybolt Universal Viscosity and Saybolt Furol Viscosity at 100 F and 122 F, respectively, and Kinematic Viscosity is taken from A.S.T.M. D2161-63T. At other temperatures, the Saybolt Viscosities vary only slightly.

Saybolt Viscosities above those shown are given by the relationships:

$$\text{Saybolt Universal Seconds} = \text{centistokes} \times 4.6347$$

$$\text{Saybolt Furol Seconds} = \text{centistokes} \times 0.4717$$

**Problem 1:** Determine the absolute viscosity of an oil which has a kinematic viscosity of 82 centistokes and a specific gravity of 0.83.

**Solution 1:** Connect 82 on the kinematic viscosity scale with 0.83 on the specific gravity scale; read 67 centipoise at the intersection on the absolute viscosity scale.

**Problem 2:** Determine the absolute viscosity of an oil having a specific gravity of 0.83 and a Saybolt Furol viscosity of 40 seconds.

**Solution 2:** Connect 0.83 on the specific gravity scale with 40 seconds on the Saybolt Furol scale; read 67 centipoise at the intersection on the absolute viscosity scale.

To obtain density in kilograms per litre (kg/litre) divide density in kg/m<sup>3</sup> by 10<sup>3</sup>

For formulas, see page 1-3.

## INTERNATIONAL SYSTEM OF UNITS (SI)

The name *Système International d'Unités* (International System of Units), with abbreviation SI, was adopted by the 11th General Conference of Weights and Measures in 1960.

This system includes three classes of units:

- (1) base units
- (2) supplementary units
- (3) derived units

Together these form the coherent system of SI units.

BASE UNITS	Quantity	Name	Symbol
	length	metre	m
	mass	kilogram	kg
	time	second	s
	electric current	ampere	A
	thermodynamic temperature	kelvin	K
	luminous intensity	candela	cd
	amount of substance	mole	mol

SUPPLEMENTARY UNITS	Quantity	Name	Symbol
	Plain Angle	radian	rad
	Solid Angle	steradian	sr

DERIVED UNITS	Quantity	Name	Symbol	Equivalents
	frequency	hertz	Hz	1 Hz = 1 cycle/s
	force	newton	N	1 N = 1 kg/m/s <sup>2</sup>
	pressure and stress	pascal	Pa	1 Pa = 1 N/m <sup>2</sup>
	work, energy, quantity of heat	joule	J	1 J = 1 N m
	power	watt	W	1 W = 1 J/s
	quantity of electricity	coulomb	C	1 C = 1 A s
	electric potential, potential difference, tension, electromotive force	volt	V	1 V = 1 W/A
	electric capacitance	farad	F	1 F = 1 A s/v
	electric resistance	ohm	Ω	1 Ω = 1 V/A
	electric conductance	siemens	S	1 S = 1 Ω <sup>-1</sup>
	flux of magnetic induction, magnetic flux	weber	Wb	1 Wb = 1 V s
	magnetic flux density, magnetic induction	tesla	T	1 T = 1 Wb/m <sup>2</sup>
	inductance	henry	H	1 H = 1 V s/A
	luminous flux	lumen	lm	1 lm = 1 cd sr
	illumination	lux	lx	1 lx = 1 lm/m <sup>2</sup>

## INTERNATIONAL SYSTEM OF UNITS (SI) (Cont'd)

Certain units which are outside the SI system but have international recognition and use, will continue to be used. The most important of these are:

### EXCEPTIONS

**TIME:** In addition to the second (s) the following units will also continue in use:

Name	Symbol
minute	min
hour	h
day	d

Other units such as week, month and year will also continue in use.

### PLANE ANGLE:

In addition to the radian (rad) the following units will continue to be used:

Name	Symbol
degree	°
minute	'
second	"

### TEMPERATURE:

In addition to the kelvin (K), which relates to the absolute or thermodynamic scale, customary temperatures will be measured in degrees Celsius (°C), formerly called centigrade. The degree intervals on the Kelvin and Celsius scales are identical, but, whereas 0 Kelvin is absolute zero, 0 degrees Celsius is the temperature of melting ice.

### Factor

10 <sup>12</sup>	tera	T
10 <sup>9</sup>	giga	G
10 <sup>6</sup>	mega	M
10 <sup>3</sup>	kilo	k
10 <sup>2</sup>	hecto	h
10	deca	da
10 <sup>-1</sup>	deci	d
10 <sup>-2</sup>	centi	c
10 <sup>-3</sup>	milli	m
10 <sup>-6</sup>	micro	μ
10 <sup>-9</sup>	nano	n
10 <sup>-12</sup>	pico	p
10 <sup>-15</sup>	fermto	f
10 <sup>-18</sup>	atto	a

### DECIMAL MULTIPLES AND SUB-MULTIPLES OF SI UNITS — PREFIXES:

When a prefix is added to a unit it's considered to be combined with that unit, forming a new unit symbol which can be raised to a positive or negative power and which can be combined with other unit symbols to form compound units. When a combined prefix and symbol is raised to a positive (or negative) power they must be considered as one whole individual unit and not as separate entities.

Primary units are spaced apart,

e.g. N m (newton metre)  
kW h (kilowatt hour)

Prefixes are placed immediately adjacent to the unit.

e.g. MN (meganewton)  
kJ (kilojoule)

### WRITTEN USE OF SYMBOLS AND PREFIXES

### Conversion Equivalents

The conversion equivalents given on this page and pages B - 11, B - 12, are based generally on British Standard 350 : Part 1 : 1974. In some cases the degree of rounding has been adjusted to an extent considered to be of value to a practical engineer.

The special name 'pascal' (symbol Pa) has been given to the unit N/m<sup>2</sup> (1 Pa = 1 N/m<sup>2</sup>).

1 mm Hg is also known by the name 'torr'.

The international standard atmosphere (1 atm) = 101 325 pascals or 1.013 25 bar. This is equal to 1.033 23 kgf/cm<sup>2</sup> or 14.6959 lbf/in<sup>2</sup>.

The technical (metric) atmosphere (1 at) = 1 kgf/cm<sup>2</sup> or 0.980 66 bar. This is equal to 14.2233 lbf/in<sup>2</sup>.

The conventional reference conditions known as 'standard temperature and pressure' (stp) are: 1.01325 bar at 0°C = 14.6959 lbf/in<sup>2</sup> at 0°C.

The standard reference conditions (st) for gas are 1.013 25 bar at 15°C and dry, as defined by the International Gas Union. These may also be referred to as Metric Standard Conditions (MSC).

745.70	76.04	1.0139	550.0	1	

1 watt = 1 joule per sec = 1 newton metre per sec.

The metric horsepower is called 'cheval vapeur' (ch) or (CV) in France.

In Germany it is called the 'Pferdestärke' (PS).

Density. 1 g/cm<sup>3</sup> = 1000 kg/m<sup>3</sup> = 0.0361 lb/in<sup>3</sup>

1 kg/m<sup>3</sup> = 0.001 g/cm<sup>3</sup> = 0.0624 lb/ft<sup>3</sup>

Specific Volume. 1 cm<sup>3</sup>/g = 0.001 m<sup>3</sup>/kg = 27.68 in<sup>3</sup>/lb

1 m<sup>3</sup>/kg = 1000 cm<sup>3</sup>/g = 16.0185 ft<sup>3</sup>/lb

For calculations for pipe other than Schedule 40 and other than 100 metres long, and for other temperature/pressure conditions, see facing page.

### Flow of Water through Schedule 40 Steel Pipe, continued from page B – 13

#### Pressure Drop for lengths of pipe other than 100 metres

For lengths of pipe other than 100 metres the pressure drop is proportional to the length. Thus, for 50 metres of pipe, the pressure drop is approximately one-half the value given in the table . . . for 300 metres, three times the given value, etc.

#### Velocity

Velocity is a function of the cross sectional flow area; thus, it is constant for a given flow rate and is independent of pipe length.

#### Pressure Drop and Velocity for pipe other than Schedule 40

To determine the velocity or pressure drop of water through pipe other than Schedule 40, use the following formulas:

$$v_a = v_{40} \left( \frac{d_{40}}{d_a} \right)^2$$

$$\Delta p_a = \Delta p_{40} \left( \frac{d_{40}}{d_a} \right)^5$$

Subscript "a" refers to the Schedule of pipe through which velocity or pressure drop is desired.

Subscript "40" refers to the velocity or pressure drop through Schedule 40 pipe, as given in the tables on page B-13.

### Flow of Air through Schedule 40 Steel Pipe, continued from facing page

#### Pressure Drop for lengths of pipe other than 100 metres

For lengths of pipe other than 100 metres the pressure drop is proportional to the length. Thus, for 50 metres of pipe, the pressure drop is approximately one-half the value given in the table . . . for 300 metres, three times the given value, etc.

The pressure drop is also inversely proportional to the absolute pressure and directly proportional to the absolute temperature.

Therefore, to determine the pressure drop for inlet or average pressures other than 7 bar and at temperatures other than 15 C, multiply the values given in the table by the ratio:

$$\left( \frac{7 + 1.013}{p + 1.013} \right) \left( \frac{273 + t}{288} \right)$$

where:

"p" is the inlet or average gauge pressure in bars, and,

"t" is the temperature in degrees Celsius under consideration.

#### Pressure Drop through pipe other than Schedule 40

To determine the pressure drop through pipe other than Schedule 40, use the following formula:

$$\Delta p_a = \Delta p_{40} \left( \frac{d_{40}}{d_a} \right)^5$$

Subscript "a" refers to the Schedule of pipe through which pressure drop is desired.

Subscript "40" refers to the pressure drop through Schedule 40 pipe, as given in the table on facing page.

#### Flow Rate of compressed air at temperature and pressure other than Metric Standard Conditions (MSC)

The cubic metres per minute of compressed air at any pressure is inversely proportional to the absolute pressure and directly proportional to the absolute temperature.

To determine the cubic metres per minute of compressed air at any temperature and pressure other than standard conditions (MSC), multiply the value of cubic metres per minute of free air by the ratio:

$$\left( \frac{1.013}{1.013 + p} \right) \left( \frac{2.73 + t}{288} \right)$$

Commercial Steel Pipe

Based on ANSI B36.10: 1970 and BS 1600: Part 2: 1970

Commercial Steel Pipe

Based on ANSI B36.10: 1970 and BS 1600 : Part 2 : 1970

Standard Wall Pipe

Nominal Pipe Size Inches	Outside Diameter mm	Thick-ness mm	Inside Diameter mm
1/8	10.3	1.73	6.8
1/4	13.7	2.24	9.2
3/8	17.1	2.31	12.5
1/2	21.3	2.77	15.8
3/4	26.7	2.87	21.0
1	33.4	3.38	26.6
1 1/4	42.2	3.56	35.1
1 1/2	48.3	3.68	40.9
2	60.3	3.91	52.5
2 1/2	73.0	5.16	62.7
3	88.9	5.49	77.9
3 1/2	101.6	5.74	90.1
4	114.3	6.02	102.3
5	141.3	6.55	128.2
6	168.3	7.11	154.1
8	219.1 S	8.18	202.7
10	273.0 S	9.27	254.5
12	323.9 S	9.52	304.9

Extra Strong Pipe

Nominal Pipe Size Inches	Outside Diameter mm	Thick-ness mm	Inside Diameter mm
1/8	10.3	2.41	5.5
1/4	13.7	3.02	7.7
3/8	17.1	3.20	10.7
1/2	21.3	3.73	13.8
3/4	26.7	3.91	18.9
1	33.4	4.55	24.3
1 1/4	42.2	4.85	32.5
1 1/2	48.3	5.08	38.1
2	60.3	5.54	49.2
2 1/2	73.0	7.01	59.0
3	88.9	7.62	73.7
3 1/2	101.6	8.08	85.4
4	114.3	8.56	97.2
5	141.3	9.52	122.3
6	168.3	10.97	146.4
8	219.1	12.70	193.7
10	273.0	12.70	247.6
12	323.9	12.70	298.5

Double Extra Strong Pipe

Nominal Pipe Size Inches	Outside Diameter mm	Thick-ness mm	Inside Diameter mm
1/2	21.3	7.47	6.4
3/4	26.7	7.82	11.1
1	33.4	9.09	15.2
1 1/4	42.2	9.70	22.8
1 1/2	48.3	10.16	28.0
2	60.3	11.07	38.2
2 1/2	73.0	14.02	45.0
3	88.9	15.24	58.4
4	114.3	17.12	80.1
5	141.3	19.05	103.2
6	168.3	21.95	124.4
8	219.1	22.22	174.7
10	273.0	25.40	222.2
12	323.9	25.40	273.1

**Stainless Steel Pipe**

Based on ANSI B36.19-1965 and BS 1600 : Part 2 : 1970

Schedule 5 S

Nominal Pipe Size Inches	Outside Diameter mm	Thick-ness mm	Inside Diameter mm
½	21.3	1.65	18.0
¾	26.7	1.65	23.4
1	33.4	1.65	30.1
1¼	42.2	1.65	38.9
1½	48.3	1.65	45.0
2	60.3	1.65	57.0
2½	73.0	2.11	68.8
3	88.9	2.11	84.7
3½	101.6	2.11	97.4
4	114.3	2.11	110.1
5	141.3	2.77	135.8
6	168.3	2.77	162.8
8	219.1	2.77	213.6
10	273.0	3.40	266.2
12	323.9	3.96	316.0

Schedule 10 S

Nominal Pipe Size Inches	Outside Diameter mm	Thick-ness mm	Inside Diameter mm
1/8	10.3	1.24	7.8
¼	13.7	1.65	10.4
3/8	17.1	1.65	13.8
½	21.3	2.11	17.1
¾	26.7	2.11	22.5
1	33.4	2.77	27.9
1¼	42.2	2.77	36.7
1½	48.3	2.77	42.8
2	60.3	2.77	54.8
2½	73.0	3.05	66.9
3	88.9	3.05	82.8
3½	101.6	3.05	95.5
4	114.3	3.05	108.2
5	141.3	3.40	134.5
6	168.3	3.40	161.5
8	219.1	3.76	211.6
10	273.0	4.19	264.6
12	323.9	4.57	314.8

Schedule 40 S

1/8 to 12 Values are the same, size for size, as those shown on page B – 17 for Standard Wall Pipe

Schedule 80 S

1/8 to 12 Values are the same, size for size, as those shown on page B – 17 for Extra Strong Pipe.

## Commercial Steel Pipe

Selected from ISO 336 - 1974 and BS 3600 : 1973

$$\text{Theoretical Power} = \frac{QH\rho}{6116 \times 10^3} = \frac{Qp}{600} \text{ kilowatts}$$

$$\text{Power Demand (Brake Power)} = \frac{\text{Theoretical Power}}{e_p}$$

where: Q = Flow rate in litres per minute  
H = Pump head in metres  
ρ = Density of liquid in kg/m<sup>3</sup>  
p = Pressure in bar gauge  
e<sub>p</sub> = Pump efficiency

Overall efficiency (e<sub>o</sub>) takes into account all losses in the pump and driver.

$$e_o = e_p e_D e_T$$

where: e<sub>D</sub> = driver efficiency  
e<sub>T</sub> = transmission efficiency

$$e_v = \text{volumetric efficiency}$$

$$e_v (\%) = \frac{\text{actual pump displacement (Q)} (100)}{\text{theoretical pump displacement (Q)}}$$

Note: For fluids other than water, multiply table values by specific gravity. In pumping liquids with a viscosity considerably higher than that of water, the pump capacity and head are reduced. To calculate the power required for such fluids, pipe friction head must be added to the elevation head to obtain the total head; this value is inserted in the first power equation given above.
